FOREIGN BROADCAST INFORMATION SERVICE

IPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service (NTIS), Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in <u>Government Reports Announcements</u> issued semimonthly by the NTIS, and are listed in the <u>Monthly Catalog of U.S. Government Publications</u> issued by the Superintendent of Documents, U.S. <u>Government Printing Office</u>, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Soviet books and journal articles displaying a copyright notice are reproduced and sold by NTIS with permission of the copyright agency of the Soviet Union. Permission for further reproduction must be obtained from copyright owner.

TECHNOLOGICAL PROCRESS: ACHIEVEMENTS AND PROSPECTS

Moscow PLANOVOYE KHOZYAYSTVO in Russian No 6, June 83 pp 3-13

[Article by D. Zhimerin, first deputy chairman of the State Committee for Science and Engineering, corresponding member of the USSR Academy of Sciences: "Technological Progress: Achievements and Prospects"]

Text At all of the stages of economic development technological progress has played a decisive role. Mechanization and automation make it possible to increase labor productivity; new production processes make it possible to decrease the expenditure of material and energy resources. The successful solution of the problem of environmental protection depends upon the realization of scientific and technical achievements. Scientific and technological progress in the production sphere has ensured a leading place for the Soviet Union in the world economy. A vivid testimonial to this is the conquest of outer space, the use of atomic energy for peaceful purposes, and the creation of modern branches of industry.

Overall programs for the most important economic problems are the basis of our state planning of the development of science and technology. During the current 5-year plan, in order to strenthen the influence on the executors of program assignments, use is being made of a new form of control which has given a good account of itself--coordination councils headed by major scientists and ministers or their deputies have been formed for the largest and most difficult programs. During the 10th Five-Year Plan as is known, the programs provided only for the production of experimental consignments of new output. This resulted in the fact that the new equipment models which had been developed and designed were not put in production for a long time and became obsolete. In the programs of the current 5-year plan the assignments for the development of new machines, instruments, and technologies have to be concluded in the series production of output.

The overall programs (and there are more than 170 of them) have been approved by the State Committee for Science and Engineering and Gosplan USSR jointly, and those in which academic scientific organizations participate have also been approved by the USSR Academy of Sciences. They provide for the creation of more than 5,000 new machines, instruments, and materials. In addition, 60 percent of the new equipment assignments are slated to be realized by the end of the 5-year plan.

The total expenditures for the development and series production of new output come to 37 billion rubles, including 14 billion rubles for scientific research and experimental designing work and for the testing of new equipment and technologies under experimental industrial conditions, and 23 billion rubles for the development of the production capacities to master the production of new products; that is, almost two-thirds of the total expenditures. This should be especially emphasized since the opinion is current that if there is scientific development work, the production of new equipment will be ensured. However, even this structure of expenditures is not optimal. Experience demonstrates that in many cases assignments for the series production of new output are not fulfilled because capacities are not ready for it. For this reason, capital expenditures for the modernization and expansion of the production of new equipment have to be even greater than expenditures for its development. Meanwhile, in the annual plans for the economic and social development of a ministry sometimes even the departments of Gosplan USSR violate agreed upon decisions on the allocation of funds for the modernization or expansion of production which has been provided for in the overall programs. A check has established that deviations of this kind represent approximately 15 percent.

The decree of the CPSU Central Committee and USSR Council of Ministers on improving the economic mechanism calls the especial attention of ministries and departments to the necessity for improving the work of all of the elements of the economy and for obtaining a maximum economic effect from the use of new equipment. According to the calculations, the economic effect from the planned amount of the introduction of new equipment will come in 1985 to around 16 billion rubies. On the Losis of the other indicator of the effectiveness of new equipment—an increase in labor productivity—around three million workers will conditionally be freed. The performance of the assignments of the overall programs will make it possible to economize in the economy more than 50 million tons of fuel, approximately 14 billion kilowatt—hours of electric energy, and more than 4 million tons of ferrous and nonferrous metals.

The fuel and energy complex is a highly important element of the overall programs. The task has been set of improving its structure, of decreasing the expenditure for energy purposes of liquid fuel, and of increasing the expenditure of hard fuel. Especial attention has been given to an accelerated development of atomic power engineering which will make it possible to fundamentally improve the country's fuel balance.

The USSR's atomic power engineering is growing at rapid rates. Our reactors with a unit capacity of one million kilowatts do not yield to their foreign analogs in their technical and economic indicators. The Ignalina Atomic Electric Power Station with reactors of 1.5 million kilowatts is being successfully built. The stab'e operations of the atomic electric power stations ensure that they are nighly economical. The cost of one kilowatthour at an atomic electric power station is less than at thermal electric power stations which operate on hard fuel. In 1982 the Smolensk Atomic Electric Power Station was put into operation.

Great Importance is attributed in the overall programs to the indicator of the standard expenditure of fuel per kilowatt-hour of supplied electric energy. Today the USSR's thermal electric power stations surpass those of the United States, the FRG, and England for standard fuel expenditures for the production of electric and thermal energy. However, in 1982 they overexpended one Giga of standard fuel for the production of one kilowatt-hour of electric energy, which led to a total overexpenditure of one million tons.

The Ekibastuz Fuel and Energy Complex is of especial importance. Extremely large coal deposits are concentrated here which are serving as a basis for the construction of thermal electric power stations with energy blocks of 500,000 kilowatts each and with a total capacity of 4 million kilowatts. In the near future they are supposed to transmit electric energy to Kazakhstan, to the Urals, and to the center of the country where a shortage of mineral fuel is being felt. But on account of the unstable operations of the Ekibastuz Hydroelectric Power Station No. 1 the problem of supplying cheap electric energy is being seriously complicated.

The overall program provides for the accelerated creation of a unique electric transmission line with a constant current of 1,500 kilovolts which will ensure the transmission to the European part of the country of up to 48 billion kilowatt-hours of cheap electric energy from the Ekibastuz hydroelectric power stations. For this reason, the USSR Ministry of Energy will have to speed up its construction.

As is known, atomic reactors do not admit of fluctuations in work loads, and large energy blocks which operate on organic fuel are also sensitive to them; in addition, fluctuations entail a decrease in the efficiency of the units. Consequently, the problem of efficiently covering the peaks of electricity work loads (morning and evening) requires a rapid solution. The overall programs provide for its solution by means of the construction of hydro-accumulating hydroelectric power stations and the creation of large-capacity maneuverable energy blocks. But the programs' assignments are not being fulfilled punctually. The USSR Ministry of Energy has dragged out the construction of the Zagorsk Hydro-Accumulating Hydroelectric Power Station with a capacity of 1.2 million kilowatts which is supposed to cover the peak morning and evening work loads, and during the night consume 1.3 million kilowatts from the electric power system, which ensures a more even work load for the atomic electric power stations and large energy blocks of the thermal electric power stations. The Ministry of Power Machine Building is delaying the production of maneuverable energy blocks.

The capacities at the Ekibastuz Thermal Electric Power Station are being mastered slowly, and this is explained to a substantial extent by defects in the boilers, turbines, and auxiliary equipment which is produced by the plants of the Ministry of Power Machine Building and the Ministry of Chemical Machine Building. Designers have created unique and large-capacity energy blocks capable of operating on the basis of the poor quality Ekibastuz coals, but the producers of this equipment are producing it with defects.

For the coal industry the overall programs provide for the introduction of new equipment and for an improvement of operating equipment, for a further mechanization of operations, and for an increase in coal mining by the open pit method. The proportion of this kind of mining in 1982 came to 38.9 percent. In accordance with the programs, a powerful rotary excavator has been created and is being used at the "Bogatyr'" Coal Mine (Ekibastuz); its productivity is 2,500 cubic meters per hour, or twice as much as that of single-scoop excavators. In underground work the proportion of mining with the help of overall mechanized equipment which increase productivity by 1.5-2 times has reached 68.8 percent.

Of fundamental importance is the overall program: "The Development and Mastery of Production Processes and Mining Machinery Systems for the Creation in the Kansko-Achinsk and Othel Basins of the Eastern Areas of the Country of Large Capacity Coal Mines With a Labor Productivity Exceeding the Attained Level by Three to Four Times." It provides for the creation of 35 types of equipment and 6 technological schemes for conducting mining operations.

The Kansko-Achinsk basin on whose basis a fuel and energy complex is being formed is unique. In time thermal electric power stations with a total capacity of 34 million kilowatts will go in to the Kansko-Achinsk Fuel and Energy Complex. Favorable geological and mining conditions make it possible to work the basin's deposits by the open method with which labor productivity is 10 times greater than with underground mining, and the cost of the coal almost 5 times less. The "Irsha-Borodinskiy" and "Nazarovskiy" Coal Mines are now operating in the basin. In 1982 approximately 37 million tons were mined, or 1.5 times more than in 1975. In 1983 it is planned to mine 40 million tons, in 1985 around 49 million, and by the end of the current century—170-200 million tons.

As a result of the introduction of the new equipment stipulated by the overall program, the average monthly labor productivity of the basin's miners has reached 815 tons compared to an average of 442 tons for open mining enterprises, and the cost of the coal has been cut in half. Compared to 1975, in 1982 the proportion of coal mining involving the use of rotary excavators increased from 22.3 to 70 percent of the total volume. Our country's first super-powerful walking excavator with a bucket capacity of 100 cubic meters and a 100-meter-long crane has been put into operation at the "Nazarovskiy" Mine for stripping operations with the progressive transport-free technology. In a year it moves 12-13 million cubic meters of stripped materials.

In the two years of the 11th Five-Year Plan a number of assignments have been carried out in the creation of new mine transport equipment for the "Berezovskiy" No. 1, "Uryupinskiy" No. 1, "Itatskiy" No. 1, and "Itatskiy" No. 2 Mines. At the first one a pilot model of the ERP-5250 rotary excavator with a capacity of 5,250 cubic meters an hour has been manufactured and is being installed; compared to its predecessor, the ERShRD-5000, it is 850 tons lighter and five percent more productive. The technological preparations have been made and production has been begun on a rotary exca-

vator with the same productivity for the performance of stripping operations. The use of a continuous-action machinery system at the "Berezovskiy" No. 1 Mine will make it possible for the first time in our country to perform stripping operations with a flow-line technology. According to the technical plan, labor productivity in the mining of the coal will come to 2,760 tons a month per worker, or more than three times the average productivity level which has been achieved at the mines of the Kansko-Achinsk Basin.

Along with successes in the realization of the programs, serious shortcomings were revealed. For example, for 1981 the Ministry of Heavy Machine Building had established for it an assignment to produce a walking excavator with a 40-cubic-meter bucket and an 85-meter crane, but this unit had not even been produced in 1982. Its production is planned only in 1985.

The chief direction of the overall programs in mining is further mechanization. Thus, tests have been concluded at the "Yasinovskaya-Glubokaya" Mine in the Donuass on the KM-130 Mechanized Complex for mining coal in steep seams. As a result, labor productivity is being increased by 1.5-2 times and the safety of the work is being ensured. At the same time, mechanization is increasing slowly in the coal industry. There is an especial lagging in the work on overall mechanization and automation.

A special-purpose program for overall coal processing resulting in enriched hard, liquid, and gaseous fuel and chemical products has been devoted to the problem of the development of the Kansko-Achinsk Basin. In this connection the State Scientific Research Power Engineering Institute imeni G. M. Krzhizhanovskiy has developed and carried out at experimental installations a technological energy process for the processing of Kansko-Achinsk coals. Its essence consists in the rapid heating of preliminarily pulverized coal; with it a large part of the moisture (seven-eight percent) is removed from it, and the resin (up to 16 percent of the weight of the substance), fuel gas (up to 6-7 percent) and tar water are separated. The dried and dewatered small grain hard fuel (with an ash and moisture content in the range of six-eight percent) represents a high quality semi-coke with a heat producing capacity of more than 6,000 calories per kilogram.

By using the resin from the semi-coke molded coke can be obtained. Experimental work at a metallurgical plant has proven that it substitutes for ordinary coke. In this way, an extensive opportunity is being created for the replacement of scarce (extracted only in mines) coking coals with open-mined brown coal.

The program provides for the construction at the Krasnoyarsk Heat and Electric Power Station of the large ETKh-175 experimental industrial installation which is capable of processing one million tons of Kansko-Achinsk coal a year. However, the USSR Ministry of Power Engineering has been violating the construction schedules. In addition, the ministry is still performing construction of the first stage in order to obtain semi-coke, resin, and gas which will be burned in the boilers of the heat and electric power station.

The problem of the overall processing and use of the brown coals of the Kansko-Achinsk Basin demands the accelerated construction of the ETKh-175 Installation in full cycle—the obtaining of semi-coke, resin and gas, and tar water and their subsequent processing into end products. At the same time, there should be the simultaneous planning of an industrial combine for the technological energy processing of coals with a capacity of 25-50 million tons of coal a year. The resolution of these issues is within the competence of Gosplan USSR and the USSR Ministry of Power Engineering.

In the petroleum and gas industry the overall programs provide for a further intensification of extraction at operating fields, and for an increase in the use of by-product gas from petroleum extraction and condensate. An increase in petroleum extraction is a very important economic problem. And although it has reached the level of 43 percent (33.3 percent in the United States), the task has been set of bringing it to 50 percent, and in the future to 55-60 percent.

Our petroleum industry occupies advanced positions for the dimensions and diversity of its flooding systems. This has helped to increase the rates of petroleum withdrawal and the degree of its recovery by 1.5-2 times. For example, the recovery level for geological petroleum stocks at the fields of the Urals and Volga without the artificial maintenance of stratum pressure was estimated at 20-30 percent, and with this maintenance at approximately 50 percent. At present around 90 percent of the extractable petroleum is recovered in the Soviet Union with the use of various flooding systems.

The solution of the problem of increasing petroleum yields is carried out by thermal methods (expelling the petroleum by means of gas and hot water, and interior fires), physical and chemical methods (flooding with the addition of various chemical agents and combinations of them), and by the injection of carbon and other gases. During the 11th Five-Year Plan it is planned to increase their use and to create equipment for an intensification of extraction. This will produce a palpable result. Thus, whereas in 1975 1.4 million tons of petroleum was extracted on the basis of new methods, and in 1980--2.7 million tons, in 1985 it is planned to obtain 8 million tons of petroleum. Especial attention is being devoted to the use of new methods at the fields of Western Siberia. It is planned here to introduce flooding with surface-active agents, and to pump alkalides and high pressure hydrocarbon gas. With the help of the new methods during the two years of the current 5-year plan around 6 million tons of petroleum was extracted, compared to an assignment of 5.4 million tons. Successful work is being done by the petroleum extracting enterprises of Kazakhstan, Tatariya, Bashkiriya, and of the Komi ASSR.

There has been a much greater use of new methods of acting upon petroleum strata. In 1982 15 steam generators were installed and put into operation, 7 units for interior burning, 15 furnaces for heating water, and other facilities. In the same year a major experiment was begun on pumping steam

highly productive steam generators have been installed here, including an experimental one with a productivity of 60 tons of steam per hour under a pressure of 160 atmospheres. Around 70,000 tons of additional petroleum has been extracted on this basis. Construction work is being completed on a complex for pumping carbon dioxide (in combination with fleating) at the Radayevskoye Field in Kuybyshev Oblast. According to misulations, the petroleum yield will increase by approximately 13 percent. If the effect is expected from the introduction of the process of in-situ communition at field sections with highly viscous petroleum. According to the brought to 53-57 percent. The method of oil displacement by sulphuric acid has become widespread in Tatariya; chemical production waste products are used as agents.

However, not all of the assignments of the overall program for increasing the petroleum yields of strata were fulfilled. For example, at the monotlorskoye Field in 1982 a high pressure pumping station for the pumping of marbon gas was not put into operation, and the installation was not provided with equipment as a result of the non-fulfillment of contractual deliveries by the enterprises of the Ministry of Chemical and Petroleum Machine Building. The Taganrog Krasnyy Kotel'shchik Plant of the Ministry of Power Machine Building has to accelerate the development and production of powerful high pressure steam generators. The petrochemical industry is in great debt to petroleum workers, since the amount of the production and the composition of the chemical agents is insufficient and is holding back the intensification of petroleum extraction.

in accordance with the overall program, the productive use of by-product as is gradually increasing. At the present time it comprises more than beforent. However, the Ministry of Petroleum Industry is being too slow arrying out measures for its full use. To this day some of this very valuable energy fuel is being burned up in flares.

The gas extraction industry's rates are increasing. In 1982 500.8 billion tubic meters of natural gas was extracted, or 7.6 percent more than in 1981. This is the result of the realization of a large complex of measures for the development and introduction of new equipment and technology.

mefore being transported almost one-half of the extracted gas undergoes preparation at automated installations. And in transporting it ever wider use is being made of computer equipment and automated management systems. In 1982 the Nevskiy Machine Building Plant imeni V. I. Lenin and the Ural Turbine Motor Plant imeni K. Ye. Voroshilov began the series production of new gas pumping units with a capacity of 16,000 and 25,000 kilowatts. Their use is supposed to decrease capital investments by approximately 17 percent and cut compressor station construction schedules almost in half.

In our country as papeline, are based on papes with a diameter of 1,420 million and a pressure in 10 atmospheres, compared to the Most mospheres productive use. This, is a high level, but the increasing arounts of an extraction and its transmission to the center of the country and for the life interest to increase the gas pressure to 100-120 atmospheres. As a result, with the same pipe diameter (1,420 millimeters) a gas pipeline's arrain, aparity will in rease by approximately 33 percent. Thus, in other to the country of gas instead of three life, it will be a country to an order to increase the stringth of the pipes the institute of life tric weiding iment Ye. O. Paton has proposed manufacturing them trum multiplyer sheet steel. The production of multiplayer piping has already been mastered at the Vyksa Metallurgical Plant.

the hermal and petrochemical industry has been given the task of improving the quality and increasing the production of polymer materials, plastics, and others. Its successful realization depends to a large extent upon the table raw materials. The programs stipulate an assignment on acceleration to an increasing the polymer is taken as a ballo, and he aper materials are used as a filler. The proportion of the table rought to 90 percent without worsening the quality transferristics made of pure polymers.

The use of the and universe fillers, in addition to decreasing the cost of the use; it, will produce a tangible saving of liquid fuel and natural and it is a structural show that by bringing the annual production of heat insulation materials to 10 million cubic meters and structural materials to 1. The tone an economy of 10 million tone of fuel can be obtained. However, the Ministry of the Chemical Industry and the Ministry of the certain tendral industry rave not been keeping to the established schedules with the assignment of the overall programs for the development and mastery of the processary materials in the required amounts.

Machine builders have many complaints against metallurgical workers about the substract the basic materials. The limited assortment of rolled goods sumpers many branches to overexpend metal, or to expend labor and overload notalworking equipment in order to obtain the shape needed by them. On usuum ut a sportage of sheet metal and the limited shapes rolled goods are replaced by cast parts, which greatly increases the weight of equipment. Playder metallurgy provides a partial solution of this problem. An overall program has been approved for the current 5-year plan which provides for the creation and mastery under industrial conditions of highly productive production processes and equipment for the production of metallic powders, filters, powder alloys, and refractory compounds, and, on their basis, new materials, coverings, and products. Calculations show that 1 ton of metallic powder replaces 1.3-2 tons of ferrous or nonferrous rolled goods (on the basis of decreasing waste and increasing strength qualities), economizes the labor of 190 michine tool operators, and eliminates the work of 80 metal-cutting markine tools. The total economy from using one ton of powder comes to 1.3-3 million rubles.

The present the in all of the branches of industry projects and semilined with are being used which are obtained by the method of powder of large. In machine building these include structural, friction, balltor, wither, and other products; in electrical engineering, radio provided, and electronics contacts, magnets, ferrites, in metalworking and in the contage elements, and ferre-electric; in metalworking and in the contage industry-bard and super-hard materials, and powder tools; the contage technology, and nuclear power engineering-heat and the contage of the contage of the contage of the contage of the contage.

The life of the production of from and allow powders and the production of from and allow powders and the production at the enterprises of the Ministry of Ferrous Metallurgy and the USSR Ministry of Nonferrous Metallurgy and the USSR Ministry of Nonferrous Metallurgy, thousand sectors have been organized for the production of the made of powders at the plants of the Ministry of Agricultural Metallurg, the Ministry of Machine Building for the Light and Food trailing, the Ministry of Machine Tool Industry has begun the made of specialized presses. The Ministry of Electrical trailing in the Ministry of Machine Ruilding work on a new type of furnace.

Ministry of Meany Machine Building has completed the development and the produce plint models of grinding and mixing equipment.

the time, there are also serious shortcomings. Thus, the commission—in the for a pulverization shop at the Sulinsk Metallurgical Plant has the formulation of the plants and shop, in the Ministry of Machine Tool Industry and Ministry of Agricultural Machine Building. As a result of the unpreparedness of several enterprises in the Ministry of Electrical Engineering and the Ministry of Communications Industry full use is not being at upper powders. These ministries have to take urgent measures

the problem of protecting metal against the problem of protecting metal against the property of the purpose overall program has set the task of increasing the purpose of metal by two-three times. More than 200 organities, the problem is a property of the problem of protecting in its realization.

timate of specialists, every year around 15 million tons of metal to correspond to making the million tons, losses reach 700 million rubles. The englished to million tons, losses reach 700 million rubles. The englishion of the anti-corrosion measures mapped out in the program will make in 1785 an economy of no less than 40,000 tons of metal, and in the englishing times approximately 160 million rubles. The process of the plasma initial powder which has been developed substantially increases in the englishing to religious of metal structures, machines, equipment, and putter. The method, in addition to protection against corrosion, strengthens the surface.

the starting freeds for livestock in combination with rational feeding; for an improvement of the system and means of procuring, processing, and starting freeds for livestock in combination with rational feeding; for an improvement of the system and methods of harvesting, storing, and arrively agricultural output; and for the modernization of operating and the realization of these measures. However, the second of the system and the system and for these measures. However, the

Mechanization specialists are frequently compelled to eliminate that it is in new equipment. There are many examples in which they put the first switch increase the productivity of the machines and the strivest. This was the case with the "Niva" grain harvesting when attachments made it possible to decrease grain losses. Rubber in the patato harvesting combines has sharply decreased damage that it is indicated as a result, there has been a decrease in their losses.

Minimum for Administrary Machine Building is holding up the production of the combine tractor, and a special rice-harvesting combine to the combine which has been adapted to combine which has been adapted the combine which has

in the overall programs have been developed for machine building the last of the programs, during the last of the programs of the programs of the production was mastered for 6,400 types of the last of and 8,500 units of obsolete equipment were removed from the last of 1983 it is planned to master 3,500 units of new equipment, and 8,500 units of obsolete equipment were removed from the last of the last of the production was mastered.

ime imposition of these overall programs was preceded by preparatory work purried out in 1980 by the State Committee for Science and Engineering countly with Gosplan USSR, the USSR Academy of Sciences, and the ministries. It may blink of experts analyzed the technical level and economicalness of the tround 19,000 different machines, complexes, and instruments. As a main of the was established that more than 70 percent of the machine building multiput corresponded to the world level, while 29 percent had to be removed it in production and replaced by new models or modernized. This data was taken into consideration in the overall programs.

in 1981, on the basis of the conclusions of experts from the State Committee in the length and Engineering, it was decided upon and agreed upon with the

t remove 1, 24 items of obs lete output from production and the with new one. Powerer, only 1,132 units were removed. In Ministry of Automotive Industry, the Ministry of Power Engineering to Iding, the Ministry of Bravy Machine Building, the Ministry of Bravy Machine Building, the Ministry of Italy on the Italy Machine Building of Italy Machine Building of Italy Machine Building of Ministry of Italy Machine Building of Italy Machine Building of Italy Machine Building of Ministry of Italy Machine Building of Italy Machine Build

tered output has been decreasing with the result that operating the growing obsolete. Thus, during the years 1975-1981 in 11 is like, ministries the proportion of products being produced more than increased, while the production of output mastered in the products of years decreased.

and experimental capacities, and of equipment and new materials, and of equipment and new materials, and of equipment and new materials, and of equipment and new equipment. However, these arguments, with the exception of the exception and the exception are invalid.

to the observed attention has been devoted to shifting the femote, and mechanical control of machinery and mechanisms to the observed fluctuation of production processes is developing rapidly. The observed relation of automated production processes control with the five-Year Plan 564 automated production processes control with the figure was 1,306, and for the finite is planned to commission more than 2,700. In 1981
The first is planned to commission more than 2,700. In 1981
The first into operation, while at the beginning of 1983

The greeded 2,700. At the same time there are serious their development, these systems are based on controlling at the controlling at the series to expensive and short-lived. The Ministry Making and the Ministry of Electrical Engineering Industry that are still measures to bring the service life of the computers in the first equipment.

the micro-electronic controls is developing at the being successfully employed in many branches.

The second for the assembly of watches at three watch plants and 267 robots have the independent of the second Moscow Plants), and 267 robots have the independent of the second manifest of the second

The later of program provides for an improvement of the production of robots. It is the first, and also the state plans for their production are being more of the full of 181-182 8.710 robots were created, or 30 period more than the plan. However, the production of robots is outstripping their use. Thus, during the past two years of the 5-year plan only 5,289 units were installed. The ministries and enterprises should take immediate measures to speed up the commissioning of these highly productive

of the time being robots are being developed and used at the initiative of initiative desired. There is no interchangability of individual units and, the quality, the conditions have not been created for their cooperative transction. The overall program maps out measures for the elimination of this shortcoming.

equipment is of great importance in solving the problem of autoin a planning and designing work and speeding up scientific research.

It greater complicitly of new equipment and production processes the

planning and designing work has been increasing: for motor vehiclesincre-tour years; and for chemical production processes as much
in years, and so forth. At the same time, the number of planning
is applied personnel has been increasing. The lack of correspondence
in the orphesity of modern equipment and the obsolete methods of
and designing it is the objective reason for this.

reference has been gained in the Soviet Union in the automation to the surface work. The creation of a system of automated and designing work (SAPDW) is most successful in those branches may in which the complexity and rapid replacability of new equiporate is makes it necessary to conduct experimental designing work to cientific and technical level and as rapidly as possible. For a good account was given of themselves by the systems for the and asymmetric engines in the All-Union Scientific Pesearch Institute of All-Union, centrifugal pumps in the All-Union Scientific Pesearch in the "Elektrosila" and a surface of Hydro-Machine Building, and metal-cutting machine tools that you is the Instrument Making Industry.

program has been worked out for 1981-1985 for the development of its assignments are fulfilled a substantial and se obtained: approximately 700 million rubles on the basis the city the estimated cost of construction, and a decrease in the line of metal of 700,000 tons, cement--1.3 million tons, and timber 190,000 cubic meters.

The pairty a few difficulties in the development of the SAPDW. It is not to get complete equipment for the automated systems; there is anization in the country which provides for the delivery of all elements of the SAPDW—from computers and programs to drafting and multiplication equipment. To the extent of its possibilities, then the anidest designing organization plans, collects the equipment, is nizes the system. For this reason, it has become necessary to the Ministry of Instrument Making with organizing the centralized to study of complete equipment sets for automated systems and of making while for the centralized repair servicing and spare parts supplies is 1910W.

to reate SAPDW large planning and designing organizations need that then computers with no less than one million operations per second than the second and the second of the SOO megabytes. The systems have to be supplied with external information input and output devices, and screens which enable between the planner and designer and the computer. This is megapytes set for the SAPDW. In addition to this, it is also

the includes nets of jobs, and table computers based on microprocessors.

matters are being used on a large scale in planning and managing the The art production and in the sphere of financial activity. At the product time there are 3,963 automated management systems for branches. electrices, and statistical and financial planning organizations. They may be a greated in accordance with the directions of the 26th CPSU Congress on monthlied technical and industrial basis, which will make it possible in the rest future to unite them into a state automated system. The many war of work by the automated management systems has confirmed their great the line is, and the computations for annual branch and enterprise plans are partitioned with the help of computers. Successful work is being done to the effected management system of Gosplan USSR and of the union republic longities, and many of the sections of the economic plans are computed on a mpider, and composed automatically. However, the expensive electronic opput and it used 11.1 hours in a 24-hour period, instead of the normative 18 holls. Most of the computer centers of the automated management system are a sipped with low productivity computers and an insufficient set of in filling all equipment (discs, displays, rapid printing). As a result, the intermited management system is unable to compute multi-variant annual plans, out to section beyour plans. The staff of the automated management system It illigate imately large, especially for the servicing of the computer equipsquare.

"The artific production Association which has been breated by the Ministry of Instrument Making has done a large amount of water on the centralized formation of programs, and has organized the training of programs. At the same time, more than half of the organizations with process systems use their own resources to develop programs. As a result, many of the automated management systems do not have complex programs for the computation of plans, or are provided with low quality mans. The transfer of the electronic equipment and the automated management asstems to centralized servicing will have to be speeded up, and this will note it possible to reduce the numbers of computer center personnel in later twofold) without detriment to the work and to increase the working time of the computers.

the eronomy has entered the third year of the 11th Five-Year Plan. One of its shief tasks is the elimination of the lagging in the fulfillment of the technological progress program and of other shortcomings in the introduction of scientific and technological achievements.

I MANAGEMENT OF BRANCH RESEARCH AND DESIGN

** LANOVOYE KHOZYAYSTVO in Russian No 12, Dec 82 pp 46-52

An acceleration of scientific and technological progress whose lits consist above all in increasing labor productivity is at the stage a highly important task of the country's economic development of the ways of accomplishing this task is in the sphere of the start of branch scientific research, planning, and designing organization. A number of indicators are used to evaluate the results of their straightfularly: the annual economic effect from projects completed the strength year and their effectiveness per ruble of expenditures; it rige expenditures per worker in terms of the amount of research the start of the amount of profits obtained from the fulfillment of continuate clients.

The samine the dynamics of these indicators on the basis of the SRI state of the Research Institute and DB [Designing Bureau] of the Ministry and Machine Building. The amount of SRDW [Scientific Research Institute] which was completed during the 10th Five-Year Plan and every year and by the end of the plan had risen to 15.7 percent. The state of production increased more rapidly, and its growth during the the 5-year plan reached 29.2 percent. Beginning with 1978 expensions are seed for halted work and work removed from production. This, was a reflection of the 1977 shift by this ministry to a cost that the system of the organization of work on the creation, mastery, and duction of new equipment on the basis of schedule orders or contracts.

replaced in 1978 by a sharp increase, and, then, there again occurred the following decline (to 85.5 percent in 1979 and 84.8 percent in 1980).

The fluctuations in effectiveness by the years of the 5-year plant and have any kind of lawful regularity.

ourling the lift. Five-Year clan there were substantial differences in the effect it eness of complete, work per ruble of the total expenditures of the right, it entific research organizations of the Ministry of Chemical Ministry of Chemical Ministry of Life, 7the All-Union Scientific Research and Jesigning Institute of When mai Machine Building, the All-Union Scientific Research Designing and the resolution institute of Hydro-Machine Building, the Jatar Scientific Research Institute of Petroleum Machine Building, and others, it moreover, the little enes were institute is both of organizations and of years in the same reginization. In particular, at the All-Union Scientific Remote the same reginization, in particular, at the All-Union Scientific Remote the same in the Building Union Philipped Petroleum and the Institute of From 37.8 to 182.6 percent of the 1975 level; and at the Institutes fluxtuates from 85 to 141.4 percent of the 1975 level.

A study of the dynamics of the average SRI and DB expenditures for a volume of work performed by them per worker also reveals quite sharp annual fluctuations opered to the base level (1975): 102 percent in 1976; 95.8 percent in 1979; and 107.9 percent in 1978; 75.4 percent in 1979; and 107.9 percent in 1978. The operation of the indicator for planning and evaluating the work of SRI and DB and for strengthening cost accounting given rise to serious doubts.

Ill areas importance for such an evaluation is the fulfillment of thematic its sent, among which research provided for by the economic plan and the ministry's plan, surrrolled by superior organizations, and reflected in the reporting is of especial note. The remaining types of work are tiken account of as economic contract work in the total number, which makes it possible for erranizations to substitute for them and fulfill the plan tur the rimber of assignments while delaying the completion of individual Skiw. According to the data of the annual reports, in 1977 the SRI and DF at the Ministry of Chemical Machine Building did not fulfill only one of the plan topics, while in 1979 they failed to fulfill more than ten. However, with respect to the number of topics the plans were exceeded: in 1977 by 70 percent, and in 1979 by almost 80 percent on the basis of an advanced completion of a corresponding number of SRDW. Moreover, during the -year plan the dynamics of the number of topics reveals a definite condicity: while in 1976 there occurred a sharp decrease (by more than 75 percent | in their number, in subsequent years it began to increase, and in 1979 the increase in the number of topics and the amount of SPDW rated by estimated cost dame to 7.5 percent in relation to the 1975 level. By the end of the 3-year plan the number of topics and increased more rapidly tean the amount of SRDW, and in 1980 reached 133.4 percent, while the amount of work came to 115.7 percent.

The plans for the amount of SRDW and for the number of topics were constantly overfulfilled, but in such a way that the former indicator exceeded the latter every year. It is important to emphasize that the planned growth rate of the amount of SRDW was lower than the actual amount every year,

the furthe number of topics there was an opposite picture. As a result, the ats a change in the average amount of SRDW in rubles per topic which the amount and the value of the work performed by the ministry's matter research and designing organizations. In 1976 this indicator formed a substantial increase: the efforts of researchers and developments were concentrated on a limited number of SRDW. However, submitted it began to decrease and in 1980 came to approximately 84-88

the filters of the utilization of the wage fund and of a ceiling on the observer of workers occupy an important place in the system of planning and string the work and in the cost accounting of SRI and DB.

I lose economic interconnection between them and the proportion and performed by co-executors. Thus, in the SRI and DB of the Ministry and Machine Building the largest economy of the wage fund through in the actual number of workers compared to the planned number percent; was achieved in 1977. Moreover, the proportion of work and the executors was substantially greater than in other years and edge the proportion of planned work by 3.3 percent. The annual is easence, consumed the entire wage fund economy.

It is results of the labor of various scientific research organizations. It is results of the labor of various scientific research organizations. It is all, not all of them are included in the plan, and because of the labor of the work of SRI and DB it is impossible to use some to this purpose. Secondly, many of the indicators do not always the necessary comparability of results. Thirdly, a large number have a very weak influence on the development of cost accounting that and DB. Thus, the amount not only of the expected but also equal economic effect from the performance of scientific and techniques does not reflect the actual decrease in the cost of output additional profits obtained. In addition, the question of with the labor of the labor of the labor of the expenditures an achieved economic effect should be compared to determine its amount per ruble of expenditure is still a contact of the labor o

repeatedly been taken in the economic literature of the weak goal time of SRI and DB plans, and of a lack of interest on their part commical and most efficient use of resources and allocated capital. It is basically the scientific and technical work of the model DB which is evaluated, and not their economic financial work.

The only plan indicator which is employed in accounting and the plants of the amount of SRDW which is planted with the break-down:

The science only the amount of expenditures for planted (and sometimes in the expenditures envisaged by the estimates.

In recent year there his been a coverent towards the use of the indicator of HI and DB output sales. Thus, in the Ministry of Electric Engineering in introduction for four years now the SRI and DB of several associations have to a receiving payment from clients for fully completed and delivered work. A colore of this kind of work is established for the organizations particity. In this experiment during the course of the SRDW planning period. In this experiment during the course of the SRDW planning period. In this experiment during the instructions on transferring branch and the first of the visite of payment for work which has been fully completed that the first of the visite which are shifting to these kinds the second of the visite and indicator of the volume of this kind of work distributed to make and by quarters.

the development of the management and of the system of evaluation is accounting of branch SRI and DB there has been the same production of accounting the production of gross output to planning the production of gross output to planning the utput sales. Despite the fact that to this day not a single is industrial ministries has completely transferred to payments the SRI and DB output (only individual organizations are being transferred, on the whole, this procedure should be given a positive

The purpose of achieving maximum efficiency not only does not exclude, but presupposes a mandatory consideration of the distinctive characteristics using presupposes a mandatory consideration of the distinctive characteristics and the purpose of achieving maximum efficiency not only does not exclude, but presupposes a mandatory consideration of the distinctive characteristics and work conditions of the SRI and DB. However, the indicators being used it the purpose in incompleted research, an increase in the number of projects being carried out at the same time, and so forth).

The realization of certain proposals will create the conditions for an improvement of the management of scientific research and development in the industrial branches, for reducing the amount of incompleted production, and for concentrating the efforts of development workers on the most important directions of scientific and technological progress. They include, first of all: the development of normative time periods for the performance in TRDW, an optimization of the network of SRI and DB in the branches, and substantiated nor-setting for the circulating capital of these organizations and providing them with their own circulating capital whose amount is established in percentages of the annual volume of performed SRDW (the remaining amount of work should be covered by bank credit).²

Un the basis of a study of the work of a number of SRI and DB of six machine building ministries—the Ministry of Electrical Engineering Industry, the

the Ministry of Machine Tool and Tool Building Industry, the Ministry of The Ministry of Chemical and Petroleum Machine Building, and the Ministry of Machine Building for the Light and Food Industry and trold Appliances, -- and also of four ministries which bear the responminimum, for the development of the production of final consumption output must 1. consumer goods) and of raw materials--the USSR Ministry of Food District, the USSR Ministry of Light Industry, the Ministry of Chemical Industry -- a conclusion can In the regarding the very great length of the time periods involved in The performance of scientific research which with the majority of the SRI the three to eight years, and one to two years with designing organizations. but selected production with SRI is as much as one-and-one-half to two years with ! performed work, while it is less with designing organizations-with some of them it exceeds War 2-year plan.

The relationship between performed research, and also the amount of incomhis production, and the amount of expenditures during the same period yer performed and delivered to the client can serve as an important The limit of the efficiency of the expenditure of SRI and DB funds. The The state of these indicators for different branches and periods Thus, with the six above machine building industries will intenship of the amount of SRDW performed during a year to the amounts all agreeditures during this period for delivered work fluctuated from 88.6 and the Ministry of Automotive Industry in 1975) to 149 percent In the Ministry of Instrument Making, Automation Equipment and Control to 1974). During individual years in many ministries this amount than the amounts of funds written off for delivered work. True, these branch differences had decreased appreciably. The amount we represent the state of the s "Industry of Electrical Engineering Industry--100.5 percent, in the 41 Jan 18 of Instrument Making, Automation Equipment and Control Systems-the Ministry of Chemical and Petroleum Machine Building--103.5, ... the Ministry of Machine Tool and Tool Building Industry-92.9 percent. the largest amount of incompleted SRDW in relation to these the nillures corresponds to the largest surplus. This indicator was the nime of in the Ministry of Electrical Engineering Industry--165 percent it want the end of 1980), while in the Ministry of Chemical and Petroleum Marker Muilding it was 141 percent, in the Ministry of Instrument Making, durant con Equipment and Control Systems -- 137.3, and in the Ministry of Ma 1991 and Tool Building Industry-only 47.4 percent. In addition, 18 1: Iter over a 15-year period (1966-1980) the level of incompleted production did not exceed 80 percent of the funds which had been released int lete research, while in the ministry of Electrical Engineering Indian in 1973 and in the Ministry of Instrument Making in 1974 it reached il ' percent.

The property relationship between changes in the above magnitudes is the pulpable and obvious. In our view, it will increase with a shift

By brace: WRI and DB to payment for work which is fully completed and delivered to the client. During this period especial importance is taken on by the regulation of the relationship between the amount of SRDW perturned turing the year and the amount of it which is delivered, a regulation which allows with bringing order into the writing off of expenditures for halted research should ensure an optimal amount of incompleted production. A decrease in the amount of the latter signifies a corresponding economy of land.

during a percent time the relationship between the amount of SRDW completed during a percent and the amount of it which is incompleted at the end of the arms and the been taking the following form. In the Ministry of Electrical Engineering Industry and the Ministry of Instrument Making—branches in which the timancing of SRDW was for a long time carried out with branch lands. He level of incompleted production exceeded the amount of performed MINA war, year and in the 9th and 10th Five—Year Plans rose appreciably. In the other branches this indicator was lower. The process of the out-time growth of continuing SRDW took place first in the Ministry of Giorni at and Petroleum Machine Building, and then included the scientific theory in I designing organizations of the Ministry of Machine Building View 1974 Industry and the Ministry of Automotive Industry.

no in the reasons for this situation is in the insufficient interconnection between the last accounting forms which are employed in connection with the process, and introduction of new equipment. The process of propering for and shifting to the new system began earliest in the Ministry of Flortrical Engineering Industry and in the Ministry of Instrument Making. lowing this period the following shortcomings showed up. Budgetary finan-The servised a restraining influence upon the growth of SRDW and of inmapleted production. The formation of YeFRNT [expansion unknown] made if possible to increase the amount of financing, and the SRDW plans were fulfilled without regard to the time periods and punctuality of its delivery the lients. Material stimulation in relation to annual economic effect engendered among the SRI and DB workers an endeavour to have as large a reserve stock as possible for the purpose of maneuvering the completion of various projects and increasing allotments to the material incentives finds. Since the amount of incompleted production is not planned, is not normed, and is not considered in evaluating the work of the SRI and DB, there were no direct factors limiting its growth.

The introduction of the amount of work which has been completed, accepted by the client, and paid for as a planning and evaluative indicator for branch SRI and DB could to a definite extent strengthen the tendency which has begun to take shape. For this reason, it is extremely essential to establish not only the amount of this work, but also the number of projects, and to introduce relative indicators as well: the amount of incompleted production per ruble of work which has been delivered and paid for, and the number of incompleted research projects. At the same time, it would be useful to plan the amount and number of SRDW which is being performed during the course of a year.

In the for by him are the basic ones among the proposed indicators.

Into of the bonuses for SRI and DB workers depend upon their magnitude. The remaining indicators, which are regarded as supplementary ones, indicators indicators, which are regarded as supplementary ones, individual SRI and DB and of industrial associations and ministries.

Individual SRI and DB and of industrial associations and ministries, analysis and financial control with the help of the latter create the accounting base for the planned management of research and for mentration of the efforts of designing and planning workers on a latter than the following analysis, control, and formation of these indicators makes the time periods.

The elements of the cost accounting of branch SRI and DB is the and economic stimulation, incentives, and bonus payments which makes It is to interest the collectives and individual workers of scienresearch organizations in the fulfillment of plans in accordance It is introved indicators. On the whole, the existing bonus practice is has been by a number of documents which establish a unified procedure The distribution and use of the economic stimulation funds, and also the wall tell the for bonus payments of additional allotments to the material fund of enterprises with regard to special branch characteristics, At the present time a special system of economic stimulation The state of the s the in operation at industrial enterprises. Its basis is made up of In the result incentives, social and cultural measures and housing construc-"All production development funds which are formed on the basis of in that develop at enterprises from a decrease in output costs from the use of scientific and technical innovations; and also Table additional profits included in the wholesale price mark-ups of mature ises for new types of products which are manufactured on the level the st domestic and foreign models, and certain other sources. In if it is to the basic sources for the formation of the funds, there is will little of the directions of the use of their monies, the procedure The model regulathe purpose, species, and character of the work for whose first ince SPI and DB workers are paid bonuses, and also the procedure in the mining the amount and payment of bonuses to the basic categories workers (the immediate topic executors, management personnel, ir. inrth).

the purposeful use of their monies for bonuses and other types in the purposeful use of their monies for bonuses and other types in tives is insufficiently tied in with the system of indicators which the cost accounting effectiveness of the work of the SRI and DB haracterized by a shortening of the production cycle, by the being performed (in percentages of the amount of delivered and by the relationship of the amount of incompleted production the amount of completed research. Meanwhile, the practice of the branch

Fig. 7 testifies to the fact that the prolongation of the sime periods for the ; "formance and subsequent delivery of work leads to an increase in the interpretation of the import of performed and delivered topics and river the importance in incompleted production.

It is the second of the production sycle the amount of delivers of the entire a general real evaluation of the lost accounting work of the entire second of

The store with the virtues of the actual annual economic effect indication at the magnitude at the present time is the primary determinant for the time of the forming the economic stimulation funds of research and manual time, and without deprecating the use of monies for the interpolation, and tomules, it should be pointed out that the time of the control of the

The basis of the economic stimulation cystem in effect has to have placed in it contrete, actual, financial and economic indicators which express the characteristic specific branch nature of the vory of SPI and DB as independent nost accounting elements capable of making efficient use of the contract and material resources granted to them and thereby of releasing ection social resources on the basis of curtailing the growth of their injurity as incompleted SPDW production, and of accelerating the turnover rate of the capital which is assigned for the fulfillment of the thematic plun.

Screetific and technological progress is impossible without the carrying out of intercornected measures which promote a large increase in the economic and social effectiveness of scientific research and development work.

It is essential to increase the role of SPDW which is performed on the tasks of inventions, and also of schedule orders (contraits) in which provided a task of inventions, and also of schedule orders (contraits) in which provided at the order to full amount of the recessary expenditures, including the the creation of a testing and experimental base. This procedure has been recognized as benefit along contents with the development of the model regulation on the introduction of a nedule orders. The abovementation of problems—an increase in the effectiveness of the material stimulation water; a strengthering of the goal-directedness of the financing

the designated for the lormation and use of the salary that it and development workers; the section of a concrete two times, not the formation of funds after the introduction of a concrete times, roject and the payment of bonuses for the fulfillment of recipies and of plans for the creation of new equipment; a decrease iterioning up of the planning topics of scientific organizations detriment of the performance of complex development work which is a relatively long period; an increase in the amount of the first interest of the general according to which complex work should be corresponded to by the salary. As acceleration of the rates of scientific and technological the expansion of social production. This concerns its leading to be try-in which the country's basic scientific and technological tential is concentrated at the present moment.

INCREATED NEW EQUIPMENT PRODUCTION DISCUSSED

Million Plantyty E KHOZYAYSTVO in Russian No 12, Dec 82 pp 41-46

Actuals by Yu. Krotov, deputy subdivision chief at Gosplan USSR: "The Frances: Flanning Levers for Increasing the Production of New Equipment",

An acceleration of the creation, mastery, and introduction into the first the achievements of science and technology is a very important reporter of the improving the economic mechanism at the current stage. This is the aim of the 12 July 1979 Decree of the CPSU Central Committee and the product of Ministers.

More than been taken to strengthen the interest of enterprises in the reality of production of high quality output. Thus, wholesale price in the like of products are established for new output and products with the like of quality, as are wholesale price discounts for second quality integery output; the total of the wholesale price mark-ups and discounts in an intered in the output sales and profits plans, but they are taken into account in evaluating plan fulfillment; and up to 70 percent of the additional profits (the total of the wholesale price mark-ups) which are the real from the sale of high quality output is used for economic stimulation.

However, these measures do not fully solve the problem. Much, in our view, depends upon the degree of enterprises' interest in expanding the production of new products. Products with the State Token of Quality and other highly effective output are above all new products. The above-mentioned measures to stimulate the production of high quality output eliminate the problem of "profitability" only when it is a matter of the fulfillment of the plan for sales and for profits, and of allotments to the economic stimulation funds. As for other, no less important work indicators (an increase in production and in labor productivity, the return on capital level, the use of the wage fund), with an increase in the production of new output they inevitably worsen. This factor seriously neutralizes the effectiveness of the above measures.

A very important demand which is being made upon the planning and computation of production volumes, labor productivity and return on capital indicators, and others is to ensure their comparability during various periods. This demand is being realized today by means of employing comparable prices and net output normatives. However, the principle of comparability is production of cotput, and its is a light to the stage character; that is, it coases with a movement to include the stage character; that is production to mastered.

the first transfer of the share of new output in the first tion. If the charge in output were not so acute zingle the share of new output is not 50 percent, but, then carry production would improve somewhat:

'''' the carry production would only 2.25 rubles

''''' the carry production would amount of NNO). In this is the first the first level, despite the first the first level, despite the first the first production, nad increased and would the first the first productively, 104,3 percent (2.4:2.3 x 100) and

It is a state to appear about an increase in labor productivity with the arm of the product to the 1982 since it did not exist in the previous The state of the s the anterprise's workers in the production of this product was a least than the product laity which had been attained at the enterprise I will fill war. that is, ny lor than 2.25 rubles per norm-hour find but I ribles, as follows from the calculations of the net output natural. For all of the achievements of the collective have been taken is a series in the technology and organization of the production of the has profit h. For this reason, they are also taken into account in the and it. it is a fintensiveness of the product and in the net output norwith a fallow from it with the result that these indicators cannot and I with the corresponding characteristics of products A and B. Their lambility to be compared manifests itself especially sharply with the many and large perturbation of new products, since the planned and it is a decision which are supposed to be achieved in a year or the after the beginning of serious projuction are reflected in their a littler later intensiveness. In these cases the real output per normloar of actual labor intensiveness will come to around 1.8 rubles.

prices for new products should reflect the socially necessary result of a purely formal, but fundamental reason: the prices for new products should reflect the socially necessary resultures which correspond to progressive norms of labor intended in the account of the contemporary level of equipment, technical production organization, and also their use value. It is essentially lessale prices be realistic: there must not be any conventional intent.

the fit indicator must also be based on technically substantiated masser, the point of departure must also be that its chief the most superfully complicated as a result of a production with products first and the frequent replacement of products is the reflection of the dynamic of production volume, labor productivity, which are used do not perform financial functions in the cost such are used do not perform financial functions in the cost such are used do not perform financial functions in the cost such are used accounting instrument. They have to be sufficient not only for the individual product, but also from the point of view.

I though of forming the net output normatives directs them

is a resided determination of the amount of labor necessary

I that of a concrete product. In estimating an increase in

I tivity this leads to an understatement of output when new pro
; i. ... ed and constantly replaced. It is necessary to develop

it is recessary to develop

it is a constantly verify other approaches to the establishment of net

it ives. One of the possible variants is set forth below.

intitude of the labor intensiveness of work, or the basic interior workers which correspond to it could be the basis for ition of a concrete net output normative. In other words, the time as with the present method of determining normatives.

with the presently accepted method, the wages (plus allotments) which is engaged in the management and servicing of production; in the amount of profits are added to the wages of production; include allotments from them for social insurance. Inis makes to added to the wages of production the allotments from them for social insurance. Inis makes to added to the wages of production the added to the wages of production the production of newly created the concrete conditions of current production, but comparability are lost in the process of estimating the growth of production that the production.

, in establishing the net output normative for a new product content of true the amount of labor intensiveness of the work, wages of the production workers and move on to the normative resembling use of the above-mentioned output of corrective recommendation for per ruble of wages of the production workers.

in the latter with this method, the net output normative for the new product

in little intensiveness which is taken into account in the wholessle price touting allulation (150 norm-hours);

the serice NNO output per norm-hour with regard to the entire output of the interprise (according to the report for the year preceding the beginning in the tion of the new product, 2.25 rubles/norm-hour);

the minimizer to product C which takes account of the attained limit of alor productivity and thereby ensures the comparability of the stallar and the growth of labor productivity and of production volumes the comparability of the stallar and the growth of labor productivity and of production volumes the comparability of the stallar and the growth of labor productivity and of production volumes.

The note of determining NNO output per unit of labor (one norm-hour of labor interpretation) and interpretation of the basic wages of production workers) in the result importance. From the point of view of formal positions, it is not to make use of NNO output per one ruble of the basic wages in the anthers which can be determined by dividing the amount of the labor of the annual report) by the basic wages of production the control of the annual report). If the new product is the control of the annual report, the average branch output per unit it is will be determined in accordance with the method of calculating in the hosignitudes which is accepted for costing calculations.

The primary I method of establishing net output normatives may encounter the primary in the interior of the price of the calculation of the price of the interior intensiveness or the basic wages of production workers, while the remaining elements of the normative are determined in the transfer of consolidated statistical reporting data. A consequence of this will be differences between the real amount of net output which is product if or in the product's price, and the magnitude of the net output normative which is established by the above method.

It would seem, however, that this objection is refuted groundlessly. The NNO indicator is introduced not in order to measure actual newly created value (on a country-wide scale the national income indicator exists for this purpose). Based on elements which reflect newly created value, it serves is an economic instrument which is designed in the first place to evaluate the amount of the work and of the productivity of the live labor of the workers of concrete enterprises, and also a number of other indicators innected with work volume.

The alternatives here consist in the following: either adhere to the accepted method of calculating the net output normatives and thereby lose a part of the growth of NNO and of labor productivity and in this way create difficulties in the conditions connected with the mastery of new products; or take fuller account of the actual dynamics of the above-mentioned indicators and create conditions which are more favorable for the mastery of

The first of the net output normatives and establish them in a consolication of the basis of the attained level of labor productivity.

to me that the above-described method for a consolidated calto the net output normatives, or one or another modification of
table of solving the problem of strengthening the interest of
in increasing the production of new output. But insofar as
to method is acceptable in the production only of those products
to incentive wholesale price mark-ups are established, including

mark-ups are given a certain time after the approval of the latter

The state of the continue is determined in the ordinary manner, that is,

refright normative is reviewed simultaneously. The new nortel but been established by the proposed method, that is, with the attained output, will be higher;

the awarding of the Token of Quality the wholesale price is not and only an incentive mark-up is established, the price setting is a local time on the operative and the community of the operative of the operative of the community of the put of the community of the community of the whole-

the domet output normatives for highly effective output and the to them have to be comparable throughout the entire period of the normative. If as a result of a deterioration of output the token of Owality is removed from specific products, the output deprived of the right to an increased net output normative up to it). But the approved NNO volume plan must not be decreased right year.

The shout an improvement of the economic planning levers which increase in the production of high quality output, let us also allowing. As a result of the distinctive characteristics of the proportion of highest quality are suffer which is used in planning does not embrace all of the branches in the many of them branch output quality indicators are in

Instructions on the procedure for planning and economic stimula-

in its planned and stimulated in other branches in which there is no inil iter of the proportion of highest quality caregory output, and is such
work done in general? It would seem that this matter is not being controlled
in the proper extent by the State Committee for Science and Engineering
and cospian ubok. A check should be conducted on the state of affairs
with the planning and economic stimulation of output quality in all branches
in it. fr.

There is still another important circumstance which has to be mentioned. This is the issue which has not only an economic but also a social conformal sugrificance is the issue of actual output quality. There are these to which products, including those with the Token of Quality, which is a manufactured with valuable raw materials and materials are made with the relations of the technical specifications, for this reises, efforts to improve output quality should be made in the first place not toward increasing the proportion of output with the Token of Coulity, the toward the production of all output, including I category couldnot, in a cordance with the technical specifications.

The performance of an experiment in the reorganization of the technical mideal arrate would be an important measure directed toward improving real warms smillty. This experiment should be performed on the basis at therefore in assert oblasts or cities, regardless of the departmental allow in a first enterprises, with the exception, perhaps, of special frame're with have special output delivery conditions. Its essence would TOTAL AT at the following. Enterprises are not released from the functions of took and all control and responsibility for output , sality. However, this performed by an enterprise first of all at the preliminary. inter- perational and inter-shop stages of production. The final control That is the lelivery of finished output to the warehouse of the sales 11. s given to the local agencies of the State Committee for Stanits is which have been reorganized with respect to their functions and rights. Thus, are given the technical control division workers whose work has been finil metrol from all of the enterprises of a city (oblast), with the intropriate feelings on their numbers and wages. Economic incentives are introduced for the workers of enterprise technical control divisions and it the State Committee for Standards for an improvement of output quality.

In conjunction with the technical control service reorganization experiment it would be useful to charge the State Committee for Standards, with the participation of Gossnab USSR, the USSR Ministry of Trade, the USSR Central Statistical Administration, and the USSR Ministry of Finance, to develop methods instructions on the procedure for exercising control over compliance with quality requirements for all output and for employing sanctions for violations of these requirements. Such methods instructions are presently in operation only for highest quality category output, or for output with incentive price mark-ups. It is clear that this is insufficient, since such products comprise only a part of total industrial production.

it is issues, in our view, are directly related to an improvement of the straining for planning scientific and technological progress and suppressingly.

EQUIPMENT EFFICIENCY, PLANNED PRICES

Moleow VESTRIF MOSKOVSKOGO UNIVERSITETA, SERIYA 6. EKONOMIKA in Russian No 3, Mar 83 pp 56-68

[Article by S. M. Yakovlev: "The Efficiency of New Equipment and the Planned Price"]

[[Pext.] During the period of mature socialsm the further improvement of the entire system of production relations occurs for the purpose of the maximum use of the (was ibilities and advantages of the planned organization of social production. An important direction of the improvement of the economic mechanism consists in the increase of the scientific level of planned pricing and in the enhancement of its role in a factor of the acceleration of the rate of scientific and technical progress. One of the central problems in this area is the dynamics of the wholesale prices for new equipment. The different trends of the change of the prices for new equipment and their correlation with the dynamics of its efficiency have a signifirunt influence on the limits of the use of new equipment in the national economy and on the rate of scientific and technical progress. The materials of the 25th and 16th CPSU Congresses indicate the importance and necessity of the decrease of the level of prices of new equipment per unit of its effective impact. The degree of such a decrease expresses the results of the progress of science and technology in the national economic and is more significant in those sectors and works, in which the efficiency of scientific and technical progress itself is greater. I Meanwhile the use of wholesale prices for the stimulation of technical progress, which pre-.times the increase of labor productivity on the basis of highly efficient equipment and the decrease of production costs, is accompanied in practice by an absolute, and at times a relativel increase of the prices for it and by the absence in some instances of a decrease of the prices for its obsolete types. The appraisal of the causes and consequences of such phenomena in economic literature is dissimilar.

The general laws of the change of value, the prices of new machines and the goods produced by means of them were formulated by K. Marx with reference to capitalism of the period of the implementation of the achievements of the industrial revolution.

Regarding in general form a machine as a means of the saving of embodied labor in the case of the production of the necessary use values, as a means "of the decrease of the cost... and price of commodity, the making of it cheaper, that is, the shortening of the working time necessary for the production of a unit of the K. Marx in conformity with this approached the question of the dyiter value and the prices for new tools of labor. Noting the inevitabilincrease of the weight and value of machines with the development of the
literacy of labor, he wrote that this processes is occurring, but not in
to the increase of the productive force itself, that is, not in proporincrease of the amount of the product, which is yielded by these maithough the value of an engine and power tools, as K. Marx noted, is
involutely, it is decreasing relatively as compared with the increasing

by the relative decrease of the cost of an absolutely more expensive for understood the change of the ratio of the price and value of the limits the increase of the "quantity of products," which are produced by the to the increase of labor productivity from the use of the machine, the limits of the cost of a unit of the commodity produced by means of the new

In the supplemented by the relative decrease of their cost. One comtine the increase of the effective impact of new machines, which are of the increase of the effective impact of new machines, which are of the increase of the basis for these interconnected processes. The social ment influence directly the amount of the value, which is determined the increase of the productivity of national labor. However, the interest of a new machine to the extent of the increase of its while making it possible to meet a great amount of the social need, the increase of the increase of the individual labor productivity. The value of a new machine (which is equivalent to several use values of machines) appears as the result of a higher individual labor productivity.

Inhor productivity, while a greater amount of social value is embodied to a smaller value and price with respect to a unit of the need, which this machine, accompany the greater value and price of the new machine. For the new machine, which is set with allowance made for its increased while reflecting the dynamics of the social value, should decrease with the nof its production and the decrease of the amount of the value as a successful. The amount of the relative decrease of the prices for new that depends on the efficiency of the latter as compared with the assiming labor and on the level at which the wholesale price will the set to the social value of the new tools of labor.

the decrease of the cost of new tools of labor as the effective imr use increases has peculiarities at the different stages of scientific
progress and depends on the degree of novelty of the equipment and
the cost of new equipment under socialism is connected with the planned
process, as well as with the development of the content and forms of
impact which is provided by the machines.

With reference to the early stages of technical progress the effective impact of the use of machines—the saving of embodied labor—was accomplished by the direct decrease of the cost of the goods being produced by means of them. K. Marx linked the relative decrease of the cost of new machines with the correlation of their value and the increase of productivity, characterizing the more efficient machines in the appear as compared with the amounts of their work."

Index contribute most only were the limits of the saving by the machine of national liber (living and embedded, paid and unpaid) extended, but the forms of the effective impact of machines became more diverse. Machines are produced not only for the purpose of the saving of embodied labor when producing the necessary products, that also for the improvement of working conditions, the development of the creative nature of labor and so on. The increase of the consumer properties of new equipment, while frequently signifying an increase of the aggregate effective socioecometric injury a unified association of workers, does not always reduce to the consumer properties of the cost of a unit of the commodity which is produced by means of it.

the braining of the forms of the effective impact of the tools of labor under the limit of the stage of scientific and technical progress makes its measurement liftiguit. It is often difficult to express the effective impact quantitatively the improvement of working conditions, the increase of labor safety techniques and other forms of the social and ecological impact). At times it is manifested in the produced by the given machines (for example, especially precise interests). The accomplishment of the scientific and technical tasks, to which the limit of and technical revolution is giving rise, is bringing about the need the description of the current value estimation, while being at the same time the effective impact in the future.

the diversity of the forms of the effective impact of new equipment and the certain difficult of its accurate and complete determination for socialist society were responsible, in our opinion, for the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the relative decrease and increase of the lack of a clear and unambiguous understanding in economic literature of the content of the content of the lack of a clear and unambiguous understanding in economic literature of the content of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous understanding in economic literature of the lack of a clear and unambiguous

the increase of the value of new machines as compared with their productivity (and capacity), which is manifested in the increase of the capital intensiveness of the increase of the volume of outlet (as compared with the use of the assimilated machines), represents the relative increase of the cost of new equipment for society. Yi. Borozdin and other economists believe that the increase of the specific value (price) of machines per unit of a separately taken parameter (productivity, capacity and so on) does not imply the relative increase of the cost of new equipment, since here the entire "aggregate effective impact" of the use of the new machine as compared with the base machine, particularly the saving of operating costs, is not taken into account. In the opinion of M. Gabrieli, the real economic effectiveness of new equipment can be established only within an economic complex, which includes all the units of the division and cooperation of labor for the meeting of a given social need, while "the cost of the meeting of the ultimate need" as a result of scientific and technical progress should not increase. He proposed to elaborate its standard. In

in the relative decrease of the cost of new equipment per unit of the cost of the coccurs if the increase of its aggregate effective impact surpasses in the cost its value and price in case of the conformity of the structure of its inpact itself to the socially necessary structure. The point is that the cost interest the factors of the aggregate effective impact of new equipment in the latter can be achieved by the improvement of the various technical parameters of the equipment (its productivity, capacity, reliability, included and itself the economy of the current and one-time expenditure in the cost in the increase of the social impact in various in partions. It does make a difference to society, by the increase of the cost indicated at the increase of the social impact of new equipment increase in the given moment the socially necessary proportion between the increase which ensure it objectively exists in the national economy.

the foregoing it is possible to distinguish in the structure of the struct

the effective impact of equipment in the form of the social impact The state of socialism as a higher stage of the development of so-However, one must not forget the material basis of the social im-The increase of the aggrewith the layer impact of new equipment by the increase of the social impact presumes as a rule, be accomplished by the de-The latter. In case of the long-term effect of the tendency toward the the national economic impact of new equipment by means of the increase attended to social impact a situation can arise, when the material bases of The limit increase of the latter will be weakened. Such a process can compli-The services of the amounts of national labor, which are embodied in the means and will limit the possibilities of the expansion of production and the surplus product for the increase of the well-being and the meeting the said needs of the members of social. What has been said by not means de-Min. the Importance of the increase of the social impact of new equipment and the mend the reflection in prices. The main difficulty lies in the precise deterwithin the objectively necessary amount of the increase of the social effecthe expenditures responsible for it.

In the tomaintain the optimum structure of the primary effective impact.

In the of the primary effective impact of new equipment there dominates, the increase of its productivity and capacity, which ensures a saving of the increase of the technical and economic ters which cause only a saving of future operating expenses. In the introduction of a new machine promotes a reduction of the cost of the increase of the capital-output ratio of the introduction of the cost of the products may decrease, but the ratio increases here. Society is interested in the simultaneous decrease and capital-output ratio of products, which ensures the greatest

such that it notional labor and create, in opportunity to increase the share of the

The further embediment of the requirement on the decrease of the level of prices of new equipment per mit of its effective impact, with was formulated at the 25th out formula congresses, should be achieved by the more precise setermination of the actual national embodic impact of the new equipment out the improvement of the methods of its reflection in the prices.

the trent. Opening in the setting of trices for new equipment confirm, in our minum, the importance of the precise determination and maintenance of the object tirely he courty structure of the effective impact of new equipment. As N. T. which V is ted, the analysis of the prices for new equipment in machine building furing 1916-1978 showed that "the indicators, which characterize indirectly, not dire (1) for an interpretability of new types of machines and equipment, account the the at its portion of the effective impact of new equipment. On the average is a structure of the effective impact the inif iter, it the saving due to the annual productivity came to 10-15 percent, the the mility (reliability) -- another 10-15 percent, while the current operating exwhile .-- //- 8" persent, that is, only up to 30 percent of the increase of the cost " we were the state of the specific improvement." Here it is important to manufacture that it is often simpler and more profitable for the producers to increase 100 a shall operating parameters of new equipment than to achieve an increase of the second of the productivity of equipment, and that neither the producers nor the more best responsibility for the validity of the zaiculations on the economy of the change of the technical parameters is not rematerial in the standards. All this leads to a significant overstatement of the cal-I the new equipment as compared with its actual national economic with laws, and, as a consequence of the latter, also frequently to the relative instring of the specific value and price of the new equipment. The latter, while implying an increase of the capital intensiveness and capital-output ratio of the n: i.e. is being produced, can be covered by the saving of current expenditures for The matienal economy as a whole. However, this process is occurring more and more diwiv.13

The end mists link the tendency for the wholesale prices for new equipment to intere with the consideration in the ratio of prices of the quality and other consideration in the ratio of prices of the quality and other consideration in the ratio of prices of the quality and other consideration of the product, with the need to ensure a profitability for every prices of the product, with the changes in the system of planned pricing, which have occurred since the revision of prices in 1967 in connection with the economic reform. Obviously, this exists. However, the tendencies for an absolute and relative increase of the prices for new equipment were also noted earlier. The reasons here in a number of instances were different: in particular, the lack of precise criteria of the determination of the efficiency of new equipment and the permissible expenditures on its assimilation and the setting of temporary prices frequently led to the overstatement of the wholesale prices and so on.

These facts testify that the wholesale price is still not fully performing the role of the planning standard, an economic tool of the regulation of the limits of the use of new equipment under socialism. The increase of the cost of new equipment is unnested not with the reflection of its efficiency in the planned prices, but,

reasons, with the still tradequately predict reliable ansideration in closed the actual noticed commisting to 1 the new equip ent and actual quate efficiency. In once instances, at the new equipment tradity

The foliation of the content of the relative in the relative in the relative in the form of a small share -

the torus of an explishment: the increase of its value arranses the increase of the cost increase of the cost increase of the cost increase of the cost increase of the increase of its expensed by a smaller imcrease of the actual effective impact as a specific important increase of the actual effective impact as a specific important increase of the actual economy all its to be a mail our meters of new equipment, which found reflection in the increase of its cost increase incre

the process of the acceleration of scientific and technical progress of the contract of the force of the contract of the force of the contract of the force of the contract of the process of the section with the contract of the special potential of new teels of the frequent instances of the increase of the quality of the figure by order, without regard for the real need are accessed as the quality of the contract of the contract.

in the increase of the technical potential of new equipment in the increase of the technical potential of new equipment in the interval for sciential and technical progress. It technical the interval to new equipment, the total economic impact of which can be extent to new equipment, the total economic impact of which can be extent to new equipment of the prices. This issumption applies to a smaller extent to new equipment within the interval economy.

the increase of the cost of new equipment or are when the actual one is reas than the calculated impact, which is determined in a control to the new equipment, when the increase of the element of the new equipment is senting to the supplemented of the increase of the element of the action of the systems of machines or a calculation of the systems of the systems of the calculation of the systems o

The termical parameters of general-purpose screw-cutting machines with the termical parameters of general-purpose screw-cutting machines with the limitary from small-series production of specialized, large-series follows, speed, precision and roughness of the machining of parts are lifely stillized. The even more modern 1-k-20 general-purpose values to improve indicators of which there were also those which were not pretely in the old model, was produced during the improvement of the life form in fereised by 20 percent, while the price increased by 2.5-fold. The mineral series of the series are forced to pure the machine to a series of the series are forced to pure the machine to a series.

the continue rease of the cost of equipment with obsolescence can be assigned for the continue called relative increase of its cost. Scientific and technical continues and the process of the updating and the increase of the quality of the continue that the same time shortens the period of its obsolescence and increase of the value of the tools of labor, which are becoming obsolition to the continue relatively in price, the profitability of the production of the continue relatively in price, the profitability of the production of the continue that the continues for new equipment are set with reference to the level of the equipment which is being replaced and is obsolete, the true of the prices of the new equipment itself is possible. With the continue of the wholesale prices and rates in industry, starting in 1982, the rease of the profitability of such products were envisaged. This the more active removal from production of obsolete types of equipment and all the continues of the relative increase of its cost.

increase of the cost of equipment can occur in different forms at all the stage of designing, assimilation (the excession in the life cycle: at the stage of designing, assimilation (the excession in the life cycle: at the stage of the expenditures of assimilation), 20 miles of the enterprises are not always interested to a sufficient extent in the life prices for new equipment as its production is assimilated; instances the stage of the extent in the desired to the established standards and the actual worsening of the quality of the life to being produced while keeping unchanged the wholesale price set for the life prices in the relative increase of the cost of new equipment, which or extend to the life prices in the processing sectors to increase and can slow the life to the national economy.

it is the relative increase of the cost of new equipment depends in the first to which they affect all the components of the effective impact of the new equipment. If the increase of the price per unit of the most important technique of the most entered parameters of the equipment is accompanied by a decrease of the unit prices is only a partial relative increase of the most. If the increase of the unit prices is not accompanied by a substantial mains at current expenses or an increase of the social impact, the total increase of the new equipment per unit of effective impact occurs. The consequence, at these types of the relative changes of prices are different: whereas

the case an in rease of the treatile apital-output ratio of the 'food this a possible decrease of it. Value (although without fall to a smaller to the "counteraction" of the precision, there of the posts being produced in the interest of the value of the posts being produced in the source, the increase of the unit prices of the sew equipment can be not by a decrease of the total mount of the aggregate expenditure, of it is production and use per unit of the effective impact. This gives reason tirely the relative increase of the cost of new equipment, when the interest unit prices is offset by a decrease of the current expenditures.

like is the offsetting of the increase of the unit prices of new equipment set It is productivity by the saving of future operating expenses has definite half out sleply the exceeding of the increase of the saying by the user or the and with the increase of the expenditures on the production of this equipment is - 10) and a specific extent of such an excess is important. In general the the suit prices (the capital-output ratio) of new equipment ratio. and an additionables, if the amount of the total fund of capital investments (| | init expenditures of labor (livin, and embodied), owing to the limited (--and the tring each specific historical period of development it is forced to " the degree of the offsetting by the saving of current expenditures his the land the me-time resources which have been diverted for mapital investand the least permissible ratio between the saving of correct exand a second the one-time capital expenditures which cannot thin commonic practice the standard coefficient of efficiency, the value of and be seen, on the one hand, on the availability of assets, which can be alloicty for apital investments, and, on the other, on the need of society and a surfaces, this function. If the increase of capital investments is rovthe living of current expenditures within the limits of the standard paythe unestime diversion of resources (other conditions being equal) and that described on be justified.

It is, the use of the principle of the "social comparison" of the postive saving of current expenditures and the increase of capital investin the factores. The prices for new equipment with allowance made for
the input as compared with the equipment being replaced are determised
the resardless of each other. If the unit value of the most important
the same parameters of the new equipment increased with the simulative of operating expenses, from the point of view of the resimption and
the process of production the total capital-output ratio of the prodtive process of it can in rease.

The standard amount of the final product in the rame of the use on with a higher unit price the user needs more one-time capital erection in the case of the use of the equipment being replaced. This are used the unitarity of an increase of the equipment is being sent, since the possibility of an increase of the time transport ratio of all types of new equipment is not rule! It is possibility of an increase of the fund of abital investments if the expense of the user that and endowed the final capital investments in the sector is

if the sharp decrease of the production cost of the products being prolimited the sharp decrease of the production cost of the products being prolimited to the factories. For example, the increase of the unit value is the factories of the amount of the equipment which is being produced for the district of the question of the sources for covering the increase of the attention of this new equipment is arising. The increase of the attention is agricultural products can occur to the extent to which this in-

in relative decrease and increase of the cost of new equipment of the dissimilar role of the increase of the effective impact in the relative decrease of the cost in the increase of its value, leads to a decrease of the production in the capital-output ratio of products in society. It promotes extent the saving of national labor and the increase of the efficiently of social production. The increase of the technical and economic in the equipment, which ensures a saving of future current expendence of the production cost and, under specific conditions, it is. However, the capital-output ratio of the latter will in-

the increase of the capital-output ratio of products in itself and technical the first trends and stages of the maturity of scientific and technical trees. The first interview is the case of the substitution of more perfect machines for less with an increase of the capital-output ratio the production efficiency although not at the fastest rate. However, the increase of the capital-output is to a greater extent than the increase of its productivity. As a stage of the capital content in artificially stimulate the increase of its productivity. As a stage of the capital content is to a greater extent than the increase of its productivity. As a stage of the capital content in the national economy may be producted in the increase of the proportion of content in the increase of the proportion of the surplus product, which meeting social needs, may be complicated. In addition to this, the balance between the physical and value proportions of the national is possible.

in a point, it is necessary for the relative decrease of the cost of new equipno. It is tive impact increases, to be backed not only by the saving of curtive impact increases, but first of all by the increase of the main technical and eccnicipalities, but first of all by the increase of the main technical and eccnicipalities. (productivity, capacity and so on), which will ensure to the greatnot extent the implementation of the achievements of of scientific and technical activities in the national economy.

in the product of the methods of determining the real economic impact from the use of all the product is compared with the equipment being replaced and its reflection to the product, as well as the finding of more precise methods of estimating the relative of the cost of new products will be a most important condition the second interest of the cost of the task of the relative decrease of the cost of new equipment. The monitoring of the relative decrease of the cost of new equipment is all serve as a hindrance to the penetration into the national economy

i inpact in the wholesale prices of new products as compared with the limit of their use. It is necessary for the evaluation of the relative to the cost of new equipment not to be an external factor with respect to the limit of the drawn up, but to be one of the features of its substan-

The calculation of the price requires further improvement. The calculation of the electronic formula to the prevailing method, in our opinion, does not adetective intention to the relative decrease of the cost of new equipment, the maximum saving of aggregate national labor. Here the equivation rease of all the components of the aggregate effective impact is the rease of operating expenses and the change of the specific quire in the argument of the increase of productivity are regarded in naving the angular confidence for the user and for the national economy, with respection and the amount of the permissible additional expenditures that the composition of the components of the effective impact for the first the new equipment, does not determine the optimum structure of the first of these foctors of this effective impact and the increase of the expenditure in the control of the components of the optimum structure of the control of the components of the increase of the expenditure of the control of the components of the increase of the expenditure of the control of the components of the increase of the expenditure of the control of the control of the control of the expenditure of the control of the control of the expenditure of the control of the control of the expenditure of the control of the control of the expension of the ex

the upper limit of the price according to the indicated torrula, the old and new equipment with different specific capital expendiderived equally profitable, in our opinion, contains the possibility of the expenditures on the new equipment without an increase of 113 and its in the common parameters (productivity and so on) and does not stimuthe saving of capital expenditures in the national economy. The and the upper limit of the price increases mainly due to the maving of exand the increase of the productivity of the equipment, is that the resumnt in this calculation, then this means (on the condition that It is the price exceeds the lower limit) that as a result of the in new equipment the overall efficiency may increase, while the capitalmany ratio decreases. Obviously, there is an objective ratio between the intwo components of the effective impact, in case of which the outputwill also increase. In our opinion, it is advisable in the case of the addition of the efficiency for the determination of the upper limit of the we requipment not to take into account the saving of the operating exin oner, which forms as a result of the increase of the most important A second control of the second control of th and the expenditures of the producer, which ensure the increase of the most the eters of the new equipment and thereby have already been taken into determining the price, are the basis for this saving.

the cost of the relative decrease of the cost of new equipment is posin its of the further increase of the efficiency of scientific and tech
itself, the improvement of the reflection in the prices for new
if the actual, real national economic impact of the new equipment,
it is to be of the wholesale price in the relative decrease of the cost
is all the stages of its life cycle: From the legisle; it is
the cost of

new equipment per unit of the effective impact will promote the broadening of the unhale of the implementation of the achievements of scientific and technical progress in the national economy and the increase of the efficiency and the growth rate of all social production.

FOOTNOTES

- 1. Thus, according to the calculations of A. G. Gogoberidze, the decrease of the value of a unit of the effective impact for the new products of machine building same in 1976 to 33 percent, 1977--28 percent, 1978--33.5 percent, 1979--36.6 percent (see A. G. Gogoberidze, "The Stimulation of Technical Progress and the increase of the Quality of the Products of Machine Building by Means of Prices," "Materialy Vsesovuznogo soveshcheniya po voprosam tsenoobrazovaniya" [Materials of the All-Union Conference on Questions of Pricing], Moscow, 1981, p. 4171.

- 7. V. Lorginov and A. Matlin distinguish four basic forms of the effective impact on new machines: the increase of the output of products, the increase of the quality of the products being produced, the saving of expenditures in the use of the equipment for the user, the social impact. In the end these forms of the effective impact promote the saving of national labor and the effect of the basic economic law of socialism (see V. Loginov, A. Matlin, "The Determination of the ifficiency of New Equipment," VOPROSY EKONOMIKI, No 4, 1975, p 126).
- H. It is possible in practice of resolve these difficulties, in the opinion of some economists, by having learned to determine the main parameter of product quality (the integral indicator), which reveals more completely the aggregate effective impact of new equipment ("Izmereniye kachestva produktsii" [The Measurement of Product Quality], edited by A. V. Glichev, Moscow, 1971, p 12). Under present conditions the amount of the effective impact is determined in value form in terms of the change of the economic impact, which arises during the use of a new machine in the national economy.

SCIESTILL, HCHNICAL PROGRESS DEFINED

How a Moskovskogo Universiteta, Seriya 6. EKONOMIKA in Russian No 3.

[Arthur B. C. Mirnov: "On the Essence and Motive Forces of Scientific and rugres,"]

The study of the essence and motive forces of scientific and technical progtess under socialism constitutes in conformity with the methodology of Marxism a property of the solution of a large number of most important probless under socialism constitutes in conformity with the methodology of Marxism a property of the solution of a large number of most important probless under socialism to the diverse problems of speeding up the production relations to the level and nature of the development of the large of society, which under the conditions of socialism is the final strength of the economic mechanism,

And the question of the essence of scientific and technical progress, it should the first and all the moted that in economic literature many different definitions of it in home works scientific and technical progress is defined as the deminimum in the limitific knowledge, equipment, technology, the organization of labor it is the means of labor, 2 in others it is defined as the process of the origination and proutical use of scientific and technical achievements, the successive roal at the stages of the development and introduction of new equipment, 3 in attil utter, the basic sphere of activity of enterprises, which is connected With the inference of their technical level and the assimilation of new products and differs from their operation under the conditions of organized production.4 Unthat the second the second that the second that the second the second th and the same of the same of the fact that in them the essence of scicontille and to make a progress is identified either with the various forms of its with individual components of its specific content. Thus, in the 'it is an the extent e of scientific and technical progress is identified with one In the second -- with its stages or phases within the "in any contine" cycle; in the third-with its peculiarities as compared with the divide of enterprises. As a result the essence of scientific and to be less than the expressed incompletely, narrowly.

ientific and technical progress from the point of view of the many in the forms of the link of science with production, as well as the second of the productive forces: man and the means of labor, seem more

The processes of the constant technical, economically efficient updating of production, the levelopment and mattering for this of new knowledge..." G.S. Industrials and technical progress as an objective sequence of solution discoveries and inventions and the transfer of production functions from some technical progress. All the rails of the solutions of the constant of the solution of the solution.

in worder, an after of the positive content, definitions of this sort are frequently in a very several nature, which decreases the possibility of their use as a basis for the until and the acception entitie and technical progress.

A bined into retain of scientific and technical progress, in conformity with which it is defined as "the continuous increvement of all the aspects of social production," while "all the aspects and elements of physical production—the production of an introduction relations" are included in its content, also occurs in the laterature. Obviously, in this case scientific and technical progress is must be with the development of the mode of social production as a whole, which in the development of the mode of social production as a whole, which

in idea that a fentility and technical progress is an economic category, while its manner as inseparable from the production relations and economic laws of society, 10 is also make the typical but, in our opinion, erroneous ideas.

The last of when defining a lentitic and technical progress characterize it only the first of view of the purposeful, subjective activity of people, which is activated but for the meeting of needs, and leave aside such most important features of it is the fivity, regularity and historical conditionality. The objectivity of the metine of scientific and technical progress is thereby also concealed.

And finall, many definitions of scientific and technical progress, which exist in enhant literature, are immulated without regard for the basic logical method of catriotic, any concept through the indication of its immediate origin (a broader nacept) of specific distinction. "What does it mean to give a 'definition'? This could, first at all, to place a given concept under another, broader one," V. I.

The treaty of productive forces, which consists, in our opinion, first, in the all limits of their development into periods subject to the nature of the interaction of equipment and manpower in a specific labor process, second, in the determination of the conditions of the natural appearance and increase of the role of science in the levelopment of social production and, third, in the substantiation of the need for the analysis of the development of the productive forces from the point of view in their includes on the sociaeconomic results of production, is the basis of the definition of the essence of scientific and technical progress. This last thing, heaver, has not signify the identification of scientific and technical progress with production relations and its definition as an economic category. The development of science and technology is regarded by K. Marx first of all as a means of interacting the productive force of labor and decreasing production costs. 12 It is

by the limit of the hoology.

In the lefinition of scientific and technical progress is inseparably conlifetime identification of the peculiarities of the stages of development of
the forces, which succeed each other in conformity with certain law.

In the material basis of
the stages, which succeed each other in conformity with certain law.

In the material basis of
the stages, while the labor of the handicraft worker includes, as a rule,

The starting period is characterized by the isolation of the different labor their attachment to home workers and the specialization of the means of Thus, built this specific form of the development of productive forces with the little prerequisite of the development of machines. However, handicraft re-The production process as before is governed en-This is the strength, dexterity and skillfulness of each individual worker and This narrow "K. Marx writes, "excludes the possibility of a truly scientific In the production process." Such a possibility arises only with the for the manufactory to large-scale industry, when the transformation of the into machines occurs. The development of the power tool commenced transfer of production functions from man to tools of labor and thereby The indicated revolution. The production process begins to be freed of the limitaderistic of manpower and acquires a form of movement, which is more and on it and is governed by the internal laws of the development of this brought about the need for the appearance of technical sciences to the appearance in the system of social production of the first sciin the inical elements.

the development of the engine and the transfer to it of the function of the development of the engine and the transfer to it of the function of the development of the engine and the transfer to it of the function of the link was previously performed by the worker, were the consummation of the link revolution of the 18th and 19th centuries. "As a machine," K. Marx the means of labor acquires such a material form of existence, which is rethe replacement of manpower by the forces of nature and empirical the labor acquires application of natural science." 14

in the lows that under the conditions of mechanical engineering the need and lity of the technological application of science acquire for the first an objective law of the improvement of the process of labor and the literature of the process of labor and resent period, which is characterized by a new qualitative leap in the literature of the scientific and technical revolution. It extends the intensity of the automation of production or the transfer of the function and monitoring to means of labor, as well as the intensive fusing a standard production.

the crimical transfer of production functions from man to machine, which expresses the content of the development of productive forces and technical progress, in the productive forces are technical progress. On the one hand, by the appearance will be an rease of the role of a new element of the development of productive forces. The case a necessary condition of the further development of technology, and, another that, by the radical change of the content of labor as a result of its necessary and automation.

At the constitue the specification of the most essential traits of scientific and to but a property would be incomplete without an indication of its socioeconomic beautifules. It. Marx examined the development of technology precisely from such a rule of the production of its use dependent of the constituent of its use dependent of the constituent of the production of products, the constituent of production.

The first of the limits of the use of technology are extended to the amounts of its autional economic efficiency, which creates the conditions for the obtaining of the binitional results of the progress of science and technology than under capitalist.

The state of the s whether a mer accialism as a natural historical stage of the development of prothe tive interest, in case of which all of its components are involved in the social philobolium access as a result of the use of advanced achievements of science, while a lentility and technical activity itself is a necessary condition of the replacewould not living labor by new equipment, the continuous updating of production and the In the on this basis of its national economic efficiency. As is evident, this detimition baracterizes scientific and technical progress from the point of view of its three most essential attributes. The first of them is the objective need it-...li tur the use of the achievements of science in modern production, which is charof terized by the increase of the indicators of its science-intensiveness. By determilling and analyzing these indicators (for example, the ratio of the expenditures um selentific research and experimental design work to the volume of the production nt output) and by comparing them by sectors of industry with the analogous indicafor all untries which are developed scientifically and technically, it is possible to regularity the degree of the need of modern production for scientific research and the law. It's lentific and technical progress with respect to this most important divisore of it. At the same time, in order to obtain in this case a more complete It time, it is necessary to compare the dynamics of the science-intensiveness of with the ind the efficiency of scientific research and experimental design work. mere, in our opinion, the leading growth of the latter should be considered natural. The mechanism of the control of scientific and technical progress should be aimed it precisely such a type of development of scientific research and experimental de-SIZO WOFK.

The second attribute consists in the qualitative change of the interaction of mannewer and equipment in the process of labor and in the increase of the level of its medianization and automation. In recent years an intensive process of the development and introduction of new equipment has been under way in our country. At the name time the bulk of the enterprises are still at the stage of incomplete mechanization, which is characterized by a significant scale of manual labor. This attests to the need for the acceleration of the rate of the complete mechanization of the most important and for today the most effective direction of sci-

The filled, generalizing attribute of scientific and technical progress is character-1. The interior, which under present conditions acts as the main component in the transfer the dynamics of the efficiency of socialist production as a whole. this reason the efficiency of scientific and technical progress should the evaluation of the efficiency of production activity at the all as all and management. However, at present this latter is examined and will deliver considerable extent in isolation of the impact of scientific and to lal process, which, in turn, has considerable autonomy in the system of in-If it is impossible to recognize as sound. "The effiin the limitific and technical progress," as L. S. Blyakhman correctly notes, "I ment of the efficiency of production, and not a complement to it; the of the use of production rethes not exist alongside it."16 Thus, the integral evaluation of sciout the initial progress presumes the determination of its share in the inindicators as the national income, the productivity of national lato find the profitability, the net output and so forth, which character-In the second smallts of activity at different levels of production.

it seems, to give a general appraisal of its present state in the section of the second state of the above-cited second second

The correct interpretation of the essence of scientific and technical determination of the entire system of motive forces inherent in it is my and a condition of the construction of an effective mechanism of its acme authors, when studying this question, along with the concept of the concept of the division of labor, education, science), understanding by The transfer and factors of scientific and technical development. At the rediate causes and factors of this development (production relations, of the state of th low low to this point of view of the motive forces, group with the sources of scien-The hard and progress its internal contradictions; 18 still others, while Row w. to minion of the contradictions of scientific and technical progress as The inderstand by its motive force labor and social production. 19 The bullet us there issues, in our opinion, is of a not entirely definite and consisthe point of view of its ultimate goals--the elaboration of a set the acceleration of scientific and technical progress. As is known, In the dictions, the unity and struggle of opposites are the fundamental "the main attention," V. I. Lenin emphaof the source [in italics] of the Thus, dialectics does not divide the concepts I motive forces, but uses a unified concept of the sources of movewall, delining them as contradictions. On this basis it is possible to say that The indicated points of view, by using only the most general concepts, not bring the solution of the problem of the sources of scientific ... rugress to an end, to the requirement to identify its objective on-Although the second and third points of view do advance this

Interest, they interpret the contraliction of a centific and technical progress. Out a contraliction of the essential internal and external ties of its elements, but out a form of its development, which is void of content. The very content to the form as finder, production relations and so on) is understood as being described out addition. However, Marxist-Leninist methodology requires the study of the taken as far as the identification of its objective, essential, and the described progress and, consequently, for the construction of the contribution of its acceleration. While being a specific system and having out of the many-sitedness of scientific and technical progress itself.

How, the process of modern productive forces is the contradictory process of the temperation of the means of labor, which is connected with the limited to the process of the developeration of the contradiction consists in the fact that it brings about the means of each given level of technology. The means of the corresponding sectors of science, the developeration of the corresponding sectors of science of the correspondin

is the development of science and technology in connection with the two social aspects of production, for example, the meaningfulness and thought a bor, it is possible to distinguish a group of social contradictions as a social and technical progress. Thus, on the one hand, the progress of technical is companied by the transfer of uniform, monotonous and difficult labor to mean to machine, which makes labor more meaningful and appealing. On thus, at specific stages of technical progress (for example, in case of incomments of the property technical functions and functions which at times are rather dangerous to the property technical functions and functions which at times are rather dangerous to the property social consequences. This contradiction acts as a direct social to the property of the changeover to the complete mechanization of production, which all minutes the tendency for the one-sided development of the worker and ensures the functional combination of mental and physical labor.

in the influence of new equipment and technology on the environment, it is possible to distinguish a group of ecological contradictions of scientific and technical progress, which act as a stimulus of the elaboration of the corresponding technical problems and the development of such means of production which, while the maximum utilization of natural resources, would not disturb the equilibrium between society and the biosphere.

A. is evident, the indicated groups of contradictions act as objective motive factors at scientific and technical progress, while reflecting at the same time spelike law, of the levelopment of science and technology.

the economic contradictions of scientific and technical progress or the contradictions of production relations and the interests, which mediate the processes of reserrab, the development and introduction of new equipment, play a decisive role in the system of these motive forces. Taking into account that at present the

MECHANIZATION AND AUTOMATION USED TO PEDUCE MANUAL LABOR

Moscow MASHINOSTROITEL' in Russian No 3, Mar 83 pp 1-2

[Article by V. M. Grigor'yev, secretary of the Central Committee of the Machine and Instrument Builders' Trade Union: "Growth Reserves in Labor Productivity"]

[Text] The 26th CPSU Congress has set specific tasks for further improving liber protection in production, creating the necessary conditions to increase labor productivity, and reducing manual, unskilled, and heavy physical labor. There tasks must be resolved by the comprehensive mechanization and automation of production processes, the creation of safe technology, and the installation of equipment with safeguards to protect people from dangerous and harmful production factors. The congress pointed out the necessity to substantially increase the production of machine and equipment systems, and automatic manipulators with programmed control which make it possible to do away with unskilled manual and montonous labor, especially under conditions which are arduous or harmful to human beings.

Bearing these tasks in mind, the machine and instrument building industries are conducting systematic work to reduce manual labor in central and auxiliary production, to mechanize and automate it, and to perfect equipment and technology. All this promotes not only increased labor productivity but also a qualitative change in its content, transforming it into labor which is inspiring, skilled, and brings people a sense of satisfaction.

Until recently these issues were not receiving the necessary attention on the part of economic organs or trade unions. But after the CPSU Central Committee and USSR Council of Ministers passed the decree "On the Further Development of Machine Building in 1978-1980," the industrial sectors developed comprehensive goal-oriented programs to reduce manual labor, introduced them to collectives of production associations, enterprises, and organizations, and are currently implementing them. As a result of carrying out these programs, the years of the 11th Pive-Year Plan will see a reducation in the use of manual labor in machine and instrument building enterprises. Calculations show that USSR Cosplan targets for 1981-1985 to reduce the number of workers engaged in manual labor can be surpassed. Ministries have already found ways to overfulfill these targets by almost 17,000 persons.

But the experience of past years shows that the problem of reducing the use of manual labor can be successfully solved by daily, painstaking work of economic leaders, trade union committees, and primary organizations and governing bodies of scientific-technical associations and the All-Union Association of inventors and Pationalizers. It is necessary to apply maximum efforts for full implementation within the established time periods of integrated plans to improve conditions, labor protection, and sanitary-health measures for 1981-1985. These plans call for improving workers' labor conditions and reducing the number engaged in manual labor, especially heavy physical labor, as well as freeing women from this sort of work entirely.

Coal-directed work to mechanize manual labor is being done at the Voronezh Forginz-and-Pressing Equipment Plant imeni M. I. Kalinin.

The coating production facility there has given up the traditional cupolas, replaying them with electric furnaces. This made it possible to fully mechanize one of the labor-intensive operations—the knock-out of large castings from the molds. This was done by introducing a facility with a telescopic rolling cover and systems of balanced ventilation and wet cleaning of waste gases and dust. Its outfit also includes equipment for clearing away scorched earth, and conveyor transport equipped with exhaust ventilation. As a result, labor conditions in the shop have improved significantly. The economic effect of adopting the facility totals 13,000 rubles per year.

Since the introduction of the mechanized, continuously-operating facility for preparing the molded, self-hardening mixture, the production level has improved, as well as sanitary-hygienic labor conditions; the use of vibrating tools has become unnecessary, and dozens of molders have been freed from manual labor. At the same time, labor productivity has increased by a factor of 1.5-2, and the annual economic effect totals about 25,000 rubles.

Much is being done at this plant to mechanize auxiliary production. Every year, about 200 units of hoisting and transport mechanisms are introduced there, and non-transloaded container transport of parts and intermediate products is widely used. Currently about 3000 different containers are being used in technological production, and 12 mechanized warehouses are in operation. This has made it possible to release 90 men from manual labor. The mechanization level of loading-unloading, warehouse, and transport work is currently 86.2 percent.

This initiative of the working people of Zaporozhskaya Oblast has circulated at machine and instrument building enterprises; "Manual Labor--On the Shoulders of Machines."

Thus, an integrated, goal-oriented program for the 11th five-year period calls for the Petrodvortsovyy Watch Plant in Leningrad to mechanize the montonous manual labor of 580 watch assemblers and inspectors. At the present time, the labor of 220 persons has already been mechanized, and in just one year 150 assemblers have been released from manual jobs. The adoption of assembly robots has made it possible to convert from traditional conveyor-belt assembly to separate, all-mechanized lines equipped with robotized assembly complexes. The labor of assembly complex adjusters has become more meaningful and interesting, and less tedious. At the same time, labor

productivity in assembly increased by a factor of 5-8. For achievement of high results in the field of mechanization and automation of manual and heavy labor, the plant's collective was awarded the AUCCTU Certificate and Prize in 1982

Work is being systematically conducted to reduce the use of manual labor in the following production associations: the Armavir Vesoizmeritel' Association and the L'vov Mikropribor Association imeni 60-letiye Sovetskoy Ukrainy; the following watch plants: the Orel Yantar' Plant imeni 60-letiye SSSR, Moscow plants Nos 1 and 2 imeni S. M. Kirov, and the Minsk Plant; and also in the Leningrad Electromechanical Plant and other enterprises.

The Trade Union Central Committee is using various forms of supervision over the work being done in this direction by trade union committees and economic leaders of associations and enterprises in the machine and instrument building industries. It is being discussed in meetings of the presidium and secretariat of the Trade Union Central Committee. In the examination of sector standards, technical conditions, and targets, particular attention is being focused on outfitting machinery, tools, and equipment with mechanization and automation devices (delivery of intermediate products and parts).

Thus, in accordance with the Trade Union Central Committee initiative, the Ministry of Machine Tool and Tool Building Industry developed and submitted for the Central Committee's approval standard recommendations to modernize casting and forge-and-pressing equipment which has been taken out of production but is still in operation. Recommendations to modernize metal-cutting equipment are at the negotiating stage.

In 1982 the Trade Union Central Committee implemented selective checking of the technological part of projects to construct new production facilities and re-outfit existing ones to reduce the proportion of manual tasks. During the appraisal, specific proposals were introduced to reduce manual labor and to include additional mechanization and automation measures in the designs. This work will be continued in 1983 as well.

Significant improvement was made in the organization of work to reduce manual labor after the AUCCTU worked out an integrated, goal-oriented program for trade unions to participate in the work to reduce manual labor in the industrial sectors of the national economy in 1982-1985, and for the period up to 1990.

Ministry directives have determined the subdivisions responsible for coordination work to mechanize and automate production processes. In the Ministry of Instrument Making, Automation Equipment, and Control Systems, these obligations rest on the Soyuztekhnopribor All-Union Production Association; in the Ministry of Machine Building for Light and Food Industry and Household Appliances—on the Soyuzorgetekhavtomatizatsiya All-Union Production Association; and in the Ministry of Machine Tool and Tool Building Industry—on the Orgstankinprom Scientific—Production Association. In accordance with the Trade Union Central Committee's proposal, these ministries have created commissions, headed by deputy ministers, to monitor the drafting and implementation of goal—oriented programs to reduce manual labor. These commissions also

include responsible workers of the Trade Union Central Committee. Similar commissions have been formed in each sub-sector. Each sector designates head institutes which are responsible for implementing a unified technical policy in these issues.

With the consent of the Trade Union Central Committee, ministries have drawn up lists of machines and equipment to be removed from production. Work with such machinery involves monotonous, dangerous labor, and also conditions which are burdensome and harmful to human health. They have drawn up lists of professions where manual labor is used, subject to immediate mechanization, and set the number of workers which each of these professions may employ in such labor.

It is important to note that the plan is to reduce manual labor by adopting advanced technology and automatic manipulators with programmed control (industrial robots).

Thus, in the 11th five-year period, the Ministry of Machine Tool and Tool Building Industry plans to organize large-series production of robots for various purposes, including the servicing of metal-cutting tools, forge-and-pressing equipment, and casting machines. The Ministry of Instrument Making, Automation Equipment, and Control Systems has developed an integrated, goal-oriented program to create and adopt robots, manipulators, and robotics complexes. A similar program is also being drawn up in the Ministry of Machine Building for Light and Food Industry and Household Appliances.

Even now, loading-unloading, warehouse, and transport operations account for a large part of manual jobs. The mechanization level of these jobs is growing from year to year, but not quickly enough.

The Ministry of Machine Building for Light and Food Industry and Household Appliances' approach to this problem deserves attention. In accordance with the ministry's instructions, the Crimean Project-Design Technological Institute has developed standard resolutions to increase the organizational-technical level of loading-unloading, transport, and warehouse jobs; these have been approved by the Soyuzorgtekhavtomatizatsiya All-Union Production Association and sent to all enterprises of the sector. They list 116 different mechanization devices, the technical characteristics and types of jobs where they can be used, and the approximate cost; they indicate the manufacturing plants or developing plants and the blueprint series. Fifteen plants of the sector are responsible for preparing these small-scale mechanization devices.

Despite efforts to reduce the use of manual labor, there are still short-comings and unexploited opportunities. The USSR Gosplan targets to reduce manual labor are not always achieved, especially in the first years of the five-year period, which entails the necessity of making up the losses in subsequent years, and this is not easy to do. Therefore economic leaders and trade union committees of associations and enterprises must now assess their capabilities in resolving this problem and use them actively, which will make

it possible to improve labor conditions and the level of production, and increase labor productivity. In resolving the problem of mechanizing and automating manual tasks, the scientific-technical community must make its intribution as well—the primary organizations and governing bodies of scientific-technical associations and the All-Union Association of Inventors and Rationalizers. It is necessary to expand the practice of holding drives and contests, schools of advanced experience, and seminars. The central boards of the scientific-technical associations of machine building and instrument building industries must not stand on the sidelines in regard to such an important economic and social problem as reducing manual labor; ministries' scientific-technical councils, sectorial journals, and sectorial scientific-technical information institutes must also get involved.

Trade union committees of associations and enterprises must make wider use of principles of moral and material incentive to adopt new technology. In this effort, indicators of the implementation of measures to reduce manual labor must be included among the basic factors considered in calculating the results of socialist competition for enterprises, shops, and sections. Issues of reducing manual labor must be reflected in collectives' agreements and plans for economic and social development of labor collectives. An attitude of systematic planning, whole-hearted work, and specificness, plus initiative and a sense of lofty responsibility on the part of every worker and manager—all this will make it possible to achieve and surpass the targets for reducing the use of manual labor, which will, in turn, promote the successful fulfilling of the targets of the five-year plan by each enterprise, and by machine-building sectors as a whole.

BOOK ON SCIENTIFIC-PRODUCTION COMPLEXES

Alma-Ata NARODNOYE KHOZYAYSTVO KAZAKHSTANA in Russian No 4, Apr 83 pp 77-80

[Peview by Doctor of Economic Sciences Professor N. Mamyrov of "Nauchno-proizvodstvennyye kompleksy" [Scientific-Production Complexes] (based on materials of Kazakhstan). Authors' collective headed by Kazakh Academy of Sciences Corresponding Member U. B. Baymuratov. Alma-Ata, Nauka, 1982.]

[Text] At the stage of developed socialism, the most important factor for further social-economic growth is the intensive development of science and technology, and widespread adoption of their achievements into production. Resolution of these tasks is largely ensured by the existence of scientific-production complexes (SPC)--a progressive way to integrate science and production.

It is worth noting that the problems of SPCs have not as yet been sufficiently elucidated in the economic literature. The operating experience of SPCs in the national economy has not received ample generalization and theoretical interpretation; the conditions of forming complexes have not been sufficiently analyzed; there are no well-substantiated recommendations for choosing their form and determining their rational structure and dimensions; and questions of investments in SPCs and the economic mechanism have not been adequately formulated. In our republic, questions of SPCs have received practically no study. The book being reviewed represents an attempt to substantially fill in these gaps, and bridge the rift between theory and practice. And this makes it unquesionably timely and significant.

The book consists of two sections, nine chapters, which logically deal with both the theoretical and the practical aspects of the problem. Beginning the work with an examination of general problems of uniting science and production, the authors disclose the essential nature of this union as one of the laws governing modern economics, forming as a result of the scientific-technical revolution. The objective basis of this process, in their opinion, comes from the needs of production, on the one hand—its intensification in all directions—and from the necessity to make effective use of the accumulated scientific experience, on the other.

The most profound illustration of the drawing-together of science and production is the development of scientific-production complexes. The SPC, as the book proves, is not merely the sum of its component parts, but an integral system whose elements are interconnected on the basis of an overall goal. The SPC ensures unity for all stages of the research-production cycle, and consequently accelerates it by a factor of 1.5-2.

Practice has brought numerous types of SPCs to life. An analysis of the experience of SPCs existing in industry has made it possible to demonstrate their advantages, classify them according to various indicators, and formulate basic principles of their formation.

Several consequences of the creation of SPCs are also elucidated, in particular the influence of this process on the expansion of reproduction. With regard to this, the authors dwell on the corresponding changes in the reproduction of fixed capital and manpower.

Since SPCs are built on the principle of technological unity of all subdivisions, the investment aspects of their creation have great significance. The book examines methods of predicting and determining the effectiveness of SPCs, and also an investment model.

Also important is the examination of shortcomings in planning, administration, and incentives within the SPCs; the book makes recommendations for overcoming them. It particularly emphasizes the role of socialist competition in SPCs.

The authors recommend that the economic mechanism by which a SPC functions should as a rule be implemented in close coordination with measures to improve the level of planning and incentives in scientific-technical progress, and with the well-known decisions stipulated by the party and government to improve the economic production mechanism.

In examining the general conditions for creating SPCs in the republic, the authors show the development which has taken place in the relationship between science and production. Not only industrial but also academic science is investigated. The authors conclude that the SPC has not become sufficiently widespread in Kazakhstan. They outline a set of problems for which the republic should put together goal-oriented scientific-technical programs. Clearly it is worthwhile to include in these programs problems concerning the development of scientific-production complexes.

A special place is occupied by specific concerns of SPCs in leading sectors of Kazakh industry-ferrous and nonferrous metallurgy, phosphorus and coal industries, and machine building. A thorough analysis of the scientific potential of these sectors has shown that at the present time, SPCs are found only in nonferrous metallurgy and machine building (the latter has the most developed form of them--scientific-production associations); in the coal-mining industry a sufficiently great potential has come about. At the same time, the conditions necessary for forming new SPCs and developing existing ones are coming into being in all sectors. Taking into account the particular sectorial characteristics of developing and adopting new technology,

and also based on the presence of the scientific potential, the foundations are being laid for the creation of various types of SPCs.

It is also necessary to touch on certain of the book's shortcomings. For example, in analyzing the experience of existing SPCs, the authors focus primary attention on scientific-production associations as the most developed form of them, giving insufficient exposure to the nature of types such as institute complexes.

In elucidating the matter of SPCs' economic mechanism, it would have been best to indicate the particular characteristics of planning and incentives in various types of complexes.

In the chapters concerning SPCs in individual sectors, a more thorough examination was called for concerning the coordination of capacities of individual subdivisions making up the SPC.

But these omissions do not affect the overall value of this useful work. The authors have successfully dealt with their task and prepared a fundamental work which is of unquestionable scientific and practical interest.

PRIZEWINNERS IN GEORGIAN PRODUCTION EFFICIENCY

Tbilisi ZARYA VOSTOKA in Russian 19 Nov 82 p 2

[Text] The Georgian SSR Council of Ministers and Georgian Council of Trade Unions have summed up the results of republic socialist competition for invention and production efficiency in the first half of 1982.

The adopted decision observes that in the first half of this year over 17,000 persons, who submitted for examination 15,700 proposals, participated in socialist competition for invention and production efficiency.

In the first 6 months of the current year there was an increase in the assertiveness and creative results of the innovators, inventors and efficiency experts in the accomplishment of the most important tasks with respect to an acceleration of the rate of scientific-technical progress, the creation and use of inventions and efficiency proposals aimed at an increase in labor productivity, economies in fuel-energy and other material resources and the mechanization of manual labor.

Some 120 inventions and 12,300 efficiency proposals, including 22 inventions and 2,265 efficiency proposals aimed at economies in intermediate products, raw material and fuel-energy resources, 15 inventions and 806 efficiency proposals aimed at the mechanization of manual labor and 3 inventions and 225 efficiency proposals aimed at an increase in labor productivity, were introduced in the republic's national economy.

A savings of the order of R36.1 million, including R6.4 million from inventions, was obtained from the use of inventions and efficiency proposals.

Some 5,760 tons of metal, 1,058 tons of reinforcing-bar steel, 4,350 tons of fuel, 22 million kilowatt-hours of electric power, 8,355 cubic meters of concrete, 1,560 tons of cement and 1,290 cubic meters of lumber were saved as a result of the introduction of inventions and efficiency proposals.

The number of provisionally released workers here amounted to over 1,500, and more than 300 were transferred to mechanized work.

There was a considerable increase in the number of authors submitting proposals, and the total savings obtained from the use of inventions and efficiency

proposals passed the level achieved in the first 6 months of 1981 by R7.8 million (27.7 percent).

At the same time as a result of inadequate organization and leadership of socialist competition for invention and production efficiency a deterioration was allowed to occur in the corresponding indicators at enterprises and in organizations of the GSSR ministries of communications, land reclamation and water resources and forestry, the "Gruzugol'" Production Association and also at the Tbilisi Industrial Machine Tool-Building Association, the Rustavi Crane-Building Plant and the Poti "Elektroapparat" Plant.

The GSSR Council of Ministers and Georgian Republic Council of Trade Unions observed that a whole number of ministries, departments, enterprises and organizations still underestimates the role of the creativity of inventors and efficiency experts as a most important reserve of the growth of labor productivity, economies in fuel-energy, intermediate product and raw material resources and the mechanization of manual labor and that the innovators' efforts are not being mobilized for the accomplishment of urgent technical tasks of production (the GSSR ministries of rural construction and land reclamation and water resources, the GSSR State Committee for Supply of Petroleum Products, the "Gruzugol'" and "Gruzvinmash" production associations, the "Mikrodvigatel'" Plant, the Zestafoni "Gruzkabel'" Plant and the "Gruzsel'mash" Plant).

The leaders of certain of the republic's enterprises and organizations are failing to observe the established procedure of the compilation and presentation to the GSSR Central Statistical Administration of statistical accounts on the inflow and use of inventions and efficiency proposals, as a result of which a considerable proportion of the technical innovations and their technical-economic indicators being used in production in practice are not being duly reflected in the overall results of invention and production efficiency work for the republic as a whole.

The GSSR Council of Ministers and Georgian Republic Council of Trade Unions adopted the proposal of the republic Commission for Leadership of Competition for Invention and Production Efficiency and the Summation of Results and for the achievement of the best results in the first half of 1982 acknowledged as the winner among ministries and departments the GSSR Ministry of Motor Transport, awarding it the diploma I class. The diploma II class was awarded to the GSSR Ministry of Housing and Municipal Service and the diploma III class to the GSSR State Committee for Supply of Production Equipment for Agriculture [Goskomsel'khoztekhnika] and the Tsekavshir' Board.
